Carbon Black Cloud Python API Documentation

Release 1.3.3

Carbon Black Developer Network

Aug 09, 2021

User Guide

Release v1.3.3.

The Carbon Black Cloud Python SDK provides an easy interface to connect with Carbon Black Cloud products, including Endpoint Standard, Audit and Remediation, and Enterprise EDR. Use this SDK to more easily query and manage your endpoints, manipulate data as Python objects, and harness the full power of Carbon Black Cloud APIs.

CHAPTER 1

Major Features

- **Supports the following Carbon Black Cloud Products with extensions for new features and products planned** Endpoint Standard, Audit and Remediation, and Enterprise EDR
- **Reduced Complexity** The SDK manages the differences among Carbon Black Cloud APIs behind a single, consistent Python interface. Spend less time learning specific API calls, and more time controlling your environment.
- **More Efficient Performance** A built-in caching layer makes repeated access to the same resource more efficient. Instead of making identical API requests repeatedly, the SDK caches the results of the request the first time, and references the cache when you make future requests for the resource. This reduces the time required to access the resource later.

CHAPTER 2

API Credentials

To use the SDK and access data in Carbon Black Cloud, you must set up API keys with the correct permissions. Different APIs have different permission requirements for use, which is explained in the Developer Network Authentication Guide.

The SDK manages your API credentials for you. There are multiple ways to supply the SDK with your API credentials, which is explained in *Authentication*.

CHAPTER 3

Getting Started

Get started with Carbon Black Cloud Python SDK here. For detailed information on the objects and methods exposed by Carbon Black Cloud Python SDK, see the full SDK Documentation below.

3.1 Installation

If you already have Python installed, skip to *Use Pip*.

3.1.1 Install Python

Carbon Black Cloud Python SDK is compatible with Python 3.6+. UNIX systems usually have Python installed by default; it will have to be installed on Windows systems separately.

If you believe you have Python installed already, run the following two commands at a command prompt:

```
$ python --version
Python 3.7.5

$ pip --version
pip 20.2.3 from /usr/local/lib/python3.7/site-packages (python 3.7)
```

If "python –version" reports back a version of 3.6.x or higher, you're all set. If "pip" is not found, follow the instructions on this guide.

If you're on Windows, and Python is not installed yet, download the latest Python installer from python.org.

Ensure that the "Add Python to PATH" option is checked.

3.1.2 Use Pip

Once Python and Pip are installed, open a command prompt and type:

```
$ pip install carbon-black-cloud-sdk
```

This will download and install the latest version of the SDK from the Python PyPI packaging server.

3.1.3 Virtual Environments (optional)

If you are installing the SDK with the intent to contribute to it's development, it is recommended that you use virtual environments to manage multiple installations.

A virtual environment is a Python environment such that the Python interpreter, libraries and scripts installed into it are isolated from those installed in other virtual environments, and (by default) any libraries installed in a "system" Python, i.e., one which is installed as part of your operating system[1].

See the python.org virtual environment guide for more information.

3.1.4 Get Source Code

Carbon Black Cloud Python SDK is actively developed on GitHub and the code is available from the Carbon Black GitHub repository. The version of the SDK on GitHub reflects the latest development version.

To clone the latest version of the SDK repository from GitHub:

```
$ git clone git@github.com:carbonblack/carbon-black-cloud-sdk-python.git
```

Once you have a copy of the source, you can install it in "development" mode into your Python site-packages:

```
$ cd carbon-black-cloud-sdk-python
$ python setup.py develop
```

[1] https://docs.python.org/3/library/venv.html

This will link the version of carbon-black-cloud-sdk-python you cloned into your Python site-packages directory. Any changes you make to the cloned version of the SDK will be reflected in your local Python installation. This is a good choice if you are thinking of changing or further developing carbon-black-cloud-sdk-python.

3.2 Authentication

Carbon Black Cloud APIs require authentication to secure your data.

There are a few methods for authentication listed below. Every method requires an API Key. See the Developer Network Authentication Guide to learn how to generate an API Key.

The SDK only uses one API Key at a time. It is recommeded to create API Keys for specific actions, and use them as needed.

For example, if using the Platform Devices API to search for mission critical devices, and the Platform Live Response API to execute commands on those devices, generate one API Key with Custom Access Level with appropriate permissions. Store the Key with profile name, and reference the profile name when creating CBCloudAPI objects.

```
# import relevant modules
>>> from cbc_sdk.platform import Device
>>> from cbc_sdk import CBCloudAPI

# create Platform API object
>>> platform_api = CBCloudAPI(profile='platform')

# search for specific devices with Platform Devices API
>>> important_devs = platform_api.select(Device).set_target_priorities("MISSION_
↪CRITICAL")

# execute commands with Live Response API
>>> for device in important_devs:
...       lr_session = platform_api.live_response.request_session(device.id)
...       lr_session.create_process(r'cmd.exe /c "ping.exe 192.168.1.1"'))
...       lr_session.close()
```

For more examples on Live Response, check live-response

3.2.1 Authentication Methods

With a File:

Credentials may be stored in a `credentials.cbc` file. With support for multiple profiles, this method makes it easy to manage multiple API Keys for different products and permission levels.

```
>>> cbc_api = CBCloudAPI('~/.carbonblack/myfile.cbc', profile='default')
```

With Windows Registry:

Windows Registry is a secure option for storing API credentials on Windows systems.

```
>>> provider = RegistryCredentialProvider()
>>> cbc_api = CBCloudAPI(credential_provider=provider, profile='default')
```

With an External Credential Provider:

Credential Providers allow for custom methods of loading API credentials. This method requires you to write your own Credential Provider.

```
>>> provider = MyCredentialProvider()
>>> cbc_api = CBCloudAPI(credential_provider=provider, profile='default')
```

Not Recommended:

At Runtime:

Credentials may be passed into *CBCloudAPI()* via keyword parameters. This method should be used with caution, taking care to not share your API credentials when managing code with source control.

```
>>> cbc_api = CBCloudAPI(url='defense.conferdeploy.net', token=ABCD/1234,
...                      org_key='ABCDEFGH')
```

Not Recommended:

With Environmental Variables:

Environmental variables can be used for authentication, but pose a security risk. This method is not recommended unless absolutely necessary.

With a File

Credentials may be supplied in a file that resembles a Windows `.INI` file in structure, which allows for multiple "profiles" or sets of credentials to be supplied in a single file. The file format is backwards compatible with CBAPI, so older files can continue to be used. This is an example of a credentials file:

```
[default]
url=http://example.com
token=ABCDEFGHIJKLMNOPQRSTUVWX/12345678
org_key=A1B2C3D4
ssl_verify=false
ssl_verify_hostname=no
ssl_cert_file=foo.certs
ssl_force_tls_1_2=1
proxy=proxy.example
ignore_system_proxy=on
integration_name=MyScript/0.9.0

[production]
url=http://example.com
token=QRSTUVWXYZABCDEFGHIJKLMN/76543210
org_key=A1B2C3D4
ssl_verify=false
ssl_verify_hostname=no
ssl_cert_file=foo.certs
ssl_force_tls_1_2=1
proxy=proxy.example
ignore_system_proxy=on
integration_name=MyApplication/1.3.1
```

Individual profiles or sections are delimited in the file by placing their name within square brackets: `[profile_name]`. Within each section, individual credential values are supplied in a `keyword=value` format.

Unrecognized keywords are ignored.

By default, the CBC SDK looks for credentials files in the following locations:

- The `.carbonblack` subdirectory of the current directory of the running process.

- The `.carbonblack` subdirectory of the user's home directory.
- The `/etc/carbonblack` subdirectory on Unix, or the `C:\Windows\carbonblack` subdirectory on Windows.

Within each of these directories, the SDK first looks for the `credentials.cbc` file, then the `credentials.psc` file (the older name for the credentials file under CBAPI).

You can override the file search logic and specify the full pathname of the credentials file in the keyword parameter `credential_file` when creating the *CBCloudAPI* object.

In all cases, you will have to specify the name of the profile to be retrieved from the credentials file in the keyword parameter `profile` when creating the *CBCloudAPI* object.

Example:

```
>>> cbc_api = CBCloudAPI(credential_file='~/.carbonblack/myfile.cbc', profile='default
↪')
```

Note on File Security: It is recommended that the credentials file be secured properly on Unix. It should be owned by the user running the process, as should the directory containing it, and neither one should specify any file permissions for "group" or "other." In numeric terms, that means the file should have `400` or `600` permissions, and its containing directory should have `500` or `700` permissions. This is similar to securing configuration or key files for `ssh`. If these permissions are incorrect, a warning message will be logged; a future version of the CBC SDK will disallow access to files altogether if they do not have the correct permissions.

Credential files *cannot* be properly secured in this manner under Windows; if they are used in that environment, a warning message will be logged.

With Windows Registry

CBC SDK also provides the ability to use the Windows Registry to supply credentials, a method which is more secure on Windows than other methods.

N.B.: Presently, to use the Windows Registry, you must supply its credential provider as an "external" credential provider. A future version of the CBC SDK will move to using this as a default provider when running on Windows.

By default, registry entries are stored under the key `HKEY_CURRENT_USER\Software\VMware Carbon Black\Cloud Credentials`. Under this key, there may be multiple subkeys, each of which specifies a "profile" (as with credential files). Within these subkeys, the following named values may be specified:

*** Required**

Keyword	Value Type	Default
`url` *	`REG_SZ`	
`token` *	`REG_SZ`	
`org_key` *	`REG_SZ`	
`ssl_verify`	`REG_DWORD`	1
`ssl_verify_hostname`	`REG_DWORD`	1
`ignore_system_proxy`	`REG_DWORD`	0
`ssl_force_tls_1_2`	`REG_DWORD`	0
`ssl_cert_file`	`REG_SZ`	
`proxy`	`REG_SZ`	
`integration_name`	`REG_SZ`	

Unrecognized named values are ignored.

To use the Registry credential provider, create an instance of it, then pass the reference to that instance in the `credential_provider` keyword parameter when creating *CBCloudAPI*. As with credential files, the name of the profile to be retrieved from the Registry should be specified in the keyword parameter `profile`.

Example:

```
>>> provider = RegistryCredentialProvider()
>>> cbc_api = CBCloudAPI(credential_provider=provider, profile='default')
```

Advanced Usage: The parameters `keypath` and `userkey` to `RegistryCredentialProvider` may be used to control the exact location of the "base" registry key where the sections of credentials are located. The `keypath` parameter allows specification of the path from `HKEY_CURRENT_USER` where the base registry key is located. If `userkey`, which is `True` by default, is `False`, the path will be interpreted as being rooted at `HKEY_LOCAL_MACHINE` rather than `HKEY_CURRENT_USER`.

Example:

```
>>> provider = RegistryCredentialProvider('Software\\Contoso\\My CBC Application')
>>> cbc_api = CBCloudAPI(credential_provider=provider, profile='default')
```

Note the use of doubled backslashes to properly escape them under Python.

With an External Credential Provider

Credentials may also be supplied by writing a class that conforms to the `CredentialProvider` interface protocol. When creating *CBCloudAPI*, pass a reference to a `CredentialProvider` object in the `credential_provider` keyword parameter. Then pass the name of the profile you want to retrieve from the provider object using the keyword parameter `profile`.

Example:

```
>>> provider = MyCredentialProvider()
>>> cbc_api = CBCloudAPI(credential_provider=provider, profile='default')
```

Details of writing a credential provider may be found in the *Developing a Custom Credential Provider* document.

At Runtime

The credentials may be passed into the *CBCloudAPI* object when it is created via the keyword parameters `url`, `token`, `org_key`, and (optionally) `ssl_verify` and `integration_name`.

Example:

```
>>> api = CBCloudAPI(url='https://example.com', token='ABCDEFGHIJKLMNOPQRSTUVWX/
↪12345678',
...                   org_key='A1B2C3D4', ssl_verify=False, integration_name='MyScript/
↪1.0')
```

The `integration_name` may be specified even if using another credential provider. If specified as a parameter, this overrides any integration name specified by means of the credential provider.

With Environmental Variables

The credentials may be supplied to CBC SDK via the environment variables `CBC_URL`, `CBC_TOKEN`, `CBC_ORG_KEY`, and `CBC_SSL_VERIFY`. For backwards compatibility with CBAPI, the environment variables

`CBAPI_URL`, `CBAPI_TOKEN`, `CBAPI_ORG_KEY`, and `CBAPI_SSL_VERIFY` may also be used; if both are specified, the newer `CBC_xxx` environment variables override their corresponding `CBAPI_xxx` equivalents. To use the environment variables, they must be set before the application is run (at least `CBC_URL` or `CBAPI_URL`, and `CBC_TOKEN` or `CBAPI_TOKEN`), and the `credential_file` keyword parameter to *`CBCloudAPI`* must be either `None` or left unspecified. (The `profile` keyword parameter will be ignored.)

N.B.: Passing credentials via the environment can be insecure, and, if this method is used, a warning message to that effect will be generated in the log.

3.2.2 Explanation of API Credential Components

When supplying API credentials to the SDK *at runtime*, *with a file*, or *with Windows Registry*, the credentials include these components:

*** Required**

Keyword	Definition	Default
`url` *	The URL used to access the Carbon Black Cloud.	
`token` *	The access token to authenticate with. Same structure as `X-Auth-Token` defined in the Developer Network Authentication Guide. Derived from an API Key's Secret Key and API ID.	
`org_key` *	The organization key specifying which organization to work with.	
`ssl_verify`	A Boolean value (see below) indicating whether or not to validate the SSL connection.	`True`
`ssl_verify_hostname`	A Boolean value (see below) indicating whether or not to verify the host name of the server being connected to.	`True`
`ignore_system_proxy`	A Boolean value (see below). If this is `True`, any system proxy settings will be ignored in making the connection to the server.	`False`
`ssl_force_tls_1_2`	A Boolean value (see below). If this is `True`, the connection will be forced to use TLS 1.2 rather than any later version.	`False`
`ssl_cert_file`	The name of an optional certificate file used to validate the certificates of the SSL connection. If not specified, the standard system certificate verification will be used.	
`proxy`	If specified, this is the name of a proxy host to be used in making the connection.	
`integration_name`	The name of the integration to use these credentials. The string may optionally end with a slash character, followed by the integration's version number. Passed as part of the `User-Agent:` HTTP header on all requests made by the SDK.	

When supplying API credentials to the SDK *with environmental variables*, the credentials include these components:

Keyword	Legacy	Default
`CBC_URL`	`CBAPI_URL`	
`CBC_TOKEN`	`CBAPI_TOKEN`	
`CBC_ORG_KEY`	`CBAPI_ORG_KEY`	
`CBC_SSL_VERIFY`	`CBAPI_SSL_VERIFY`	`True`

Alternative keywords are available to maintain backwards compatibility with CBAPI.

Boolean Values

Boolean values are specified by using the strings `true`, `yes`, `on`, or `1` to represent a `True` value, or the strings `false`, `no`, `off`, or `0` to represent a `False` value. All of these are case-insensitive. Any other string value specified

will result in an error.

For example, to disable SSL connection validation, any of the following would work:

```
ssl_verify=False
ssl_verify=false
ssl_verify=No
ssl_verify=no
ssl_verify=Off
ssl_verify=off
ssl_verify=0
```

3.3 Getting Started with the Carbon Black Cloud Python SDK - "Hello CBC"

This document will help you get started with the Carbon Black Cloud Python SDK by installing it, configuring authentication for it, and executing a simple example program that makes one API call.

3.3.1 Installation

Make sure you are using Python 3. Use the command `pip install carbon-black-cloud-sdk` to install the SDK and all its dependencies. (In some environments, the correct command will be `pip3 install carbon-black-cloud-sdk` to use Python 3.)

You can also access the SDK in development mode by cloning the GitHub repository, and then executing `python setup.py develop` (in some environments, `python3 setup.py develop`) from the top-level directory. Setting your `PYTHONPATH` environment variable to the directory `[sdk]/src`, where `[sdk]` is the top-level directory of the SDK, will also work for these purposes. (On Windows, use `[sdk]\src`.)

See also the *Installation* section of this documentation for more information.

3.3.2 Authentication

In order to make use of the API, you will need an *API token,* which you will get from the Carbon Black Cloud UI. For the purposes of our example, we will need a custom key with the ability to list devices.

Log into the Carbon Black Cloud UI and go to `Settings > API Access`. Start by selecting `Access Levels` at the top of the screen and press `Add Access Level`. Fill in a name and description for your sample access level, keep `Copy permissions from` set to `None`, and, under the permission category `Device` and permission name `General information`, check the `Read` check box. Press `Save` to save and create the new access level.

Now select `API Keys` at the top of the screen and press `Add API Key`. Enter a name for the key, and, optionally, a description. For `Access Level type`, select `Custom`, and for `Custom Access Level`, select the access level you created above. Press `Save` to save and create the new API key. An `API Credentials` dialog will be displayed with the new API ID and secret key; this dialog may also be re-displayed at any time by finding the API key in the list, clicking the drop-down arrow under the `Actions` column, and selecting `API Credentials`.

We will use a credentials file to store the credential information by default. Create a directory named `.carbonblack` under your user home directory. (On Windows, this directory is generally `C:\Users\[username]`, where `[username]` is your user name.) Within this directory create a file `credentials.cbc` to store your credentials. Copy the following template to this new file:

```
[default]
url=
token=
org_key=
ssl_verify=True
```

Following the `url=` keyword, add the top-level URL you use to access the Carbon Black Cloud, including the `https://` prefix and the domain name, but without any of the path information following it.

Following the `token=` keyword, add the `API Secret Key` from the `API Credentials` dialog, followed by a forward slash (/) character, followed by the `API ID` from the `API Credentials` dialog. (The secret key is always 24 characters in length, and the API ID is always 10 characters in length.)

Following the `org_key=` keyword, add the organization key from your organization, which may be seen under the `Org Key:` heading at the top of the `API Keys` display under `Settings > API Access`. It is always 8 characters in length.

Save the completed `credentials.cbc` file, which should look like this *(example text only)*:

```
[default]
url=https://example.net
token=ABCDEFGHGIJKLMNOPQRSTUVWX/ABCDEFGHIJ
org_key=A1B2C3D4
ssl_verify=True
```

On UNIX systems, you must make sure that the `credentials.cbc` file is properly secured. The simplest commands for doing so are:

```
$ chmod 600 ~/.carbonblack/credentials.cbc
$ chmod 700 ~/.carbonblack
```

For further information, please see the *Authentication* section of the documentation, as well as the Authentication Guide on the Carbon Black Cloud Developer Network.

3.3.3 Running the Example

The example we will be running is `list_devices.py`, located in the `examples/platform` subdirectory of the GitHub repository. If you cloned the repository, change directory to `[sdk]/examples/platform`, where `[sdk]` is the top-level directory of the SDK. (On Windows, use `[sdk]\examples\platform`.) Alternately, you may view the current version of that script in "raw" mode in GitHub, and use your browser's `Save As` function to save the script locally. In that case, change directory to whichever directory you saved the script to.

Execute the script by using the command `python list_devices.py -q '1'` (in some environments, `python3 list_devices.py -q '1'`). If all is well, you will see a list of devices (endpoints) registered in your organization, showing their numeric ID, host name, IP address, and last checkin time.

You can change what devices are shown by modifying the query value supplied to the `-q` parameter, and also by using additional parameters to modify the search criteria. Execute the command `python list_devices.py --help` (in some environments, `python3 list_devices.py --help`) for a list of all possible command line parameters.

3.3.4 Inside the Example Script

Once the command-line arguments are parsed, we create a Carbon Black Cloud API object with a call to the helper function `get_cb_cloud_object()`. The standard `select()` method is used to create a query object that queries

for devices; the query string is passed to that object via the `where()` method, and other criteria are added using specific setters.

The query is an iterable object, and calling upon its iterator methods invokes the query, which, in this case, is the Search Devices API. The example script turns those results into an in-memory list, then iterates on that list, printing only certain properties of each retrieved Device object.

3.3.5 Calling the SDK Directly

Now we'll repeat this example, but using the Python command line directly without a script.

Access your Python interpreter with the `python` command (or `python3` if required) and type:

```
>>> from cbc_sdk.rest_api import CBCloudAPI
>>> from cbc_sdk.platform import Device
>>> cb = CBCloudAPI(profile='default')
```

This imports the necessary classes and creates an instance of the base `CBCloudAPI` object. By default, the file credentials provider is used. We set it to use the `default` profile in your `credentials.cbc` file, which you set up earlier.

N.B.: On Windows, a security warning message will be generated about file access to CBC SDK credentials being inherently insecure.

```
>>> query = cb.select(Device).where('1')
```

This creates a query object that searches for all devices (the '1' causes all devices to be matched, as in SQL).

```
>>> devices = list(query)
```

For convenience, we load the entirety of the query results into an in-memory list.

```
>>> for device in devices:
...     print(device.id, device.name, device.last_internal_ip_address, device.last_
↪contact_time)
...
```

Using a simple `for` loop, we print out the ID, host name, internal IP address, and last contact time from each returned device. Note that the contents of the list are `Device` objects, not dictionaries, so we access individual properties with the `object.property_name` syntax, rather than `object['property_name']`.

3.3.6 Setting the User-Agent

The SDK supports custom User-Agent's, which allow you to identify yourself when using the SDK to make API calls. The credential parameter `integration_name` is used for this. If you use a file to authenticate the SDK, this is how you could identify yourself:

```
[default]
url=http://example.com
token=ABCDEFGHIJKLMNOPQRSTUVWX/12345678
org_key=A1B2C3D4
integration_name=MyScript/0.9.0
```

See the *Authentication* documentation for more information about credentials.

3.4 Concepts

3.4.1 Platform Devices vs Endpoint Standard Devices

For most use cases, Platform Devices are sufficient to access information about devices and change that information. If you want to connect to a device using Live Response, then you must use Endpoint Standard Devices and a Live Response API Key.

```
# Device information is accessible with Platform Devices
>>> api = CBCloudAPI(profile='platform')
>>> platform_devices = api.select(platform.Device).set_os(["WINDOWS", "LINUX"])
>>> for device in platform_devices:
...   print(
      f'''
      Device ID: {device.id}
      Device Name: {device.name}

      ''')
Device ID: 1234
Device Name: Win10x64

Device ID: 5678
Device Name: UbuntuDev

# Live Response is accessible with Endpoint Standard Devices
>>> api = CBCloudAPI(profile='live_response')
>>> endpoint_standard_device = api.select(endpoint_standard.Device, 1234)
>>> endpoint_standard_device.lr_session()
url: /appservices/v6/orgs/{org_key}/liveresponse/sessions/428:1234 -> status: PENDING
[...]

For more examples on Live Response, check :doc:`live-response`
```

USB Devices

Note that `USBDevice` is distinct from either the Platform API `Device` or the Endpoint Standard `Device`. Access to USB devices is through the Endpoint Standard package `from cbc_sdk.endpoint_standard import` `from cbc_sdk.endpoint_standard`.

```
# USB device information is accessible with Endpoint Standard
>>> api = CBCloudAPI(profile='endpoint_standard')
>>> usb_devices = api.select(USBDevice).set_statuses(['APPROVED'])
>>> for usb in usb_devices:
...   print(f'''
            USB Device ID: {usb.id}
            USB Device: {usb.vendor_name} {usb.product_name}

            ''')
USB Device ID: 774
USB Device: SanDisk Ultra

USB Device ID: 778
USB Device: SanDisk Cruzer Mini
```

3.4.2 Queries

Generally, to retrieve information from your Carbon Black Cloud instance you will:

1. *Create a Query*
2. *Refine the Query*
3. *Execute the Query*

Create Queries with `CBCloudAPI.select()`

Data is retrieved from the Carbon Black Cloud with *`CBCloudAPI.select()`* statements. A `select()` statement creates a `query`, which can be further *refined with parameters or criteria*, and then *executed*.

```
# Create a query for devices
>>> device_query = api.select(platform.Device).where('avStatus:AV_ACTIVE')

# The query has not yet been executed
>>> type(device_query)
<class cbc_sdk.platform.devices.DeviceSearchQuery>
```

This query will search for Platform Devices with antivirus active.

Refine Queries with `where()`, `and_()`, and `or_()`

Queries can be refined during or after declaration with *`where()`*, *`and_()`*, and *`or_()`*.

```
# Create a query for events
>>> event_query = api.select(endpoint_standard.Event).where(hostName='Win10').and_
↪(ipAddress='10.0.0.1')

# Refine the query
>>> event_query.and_(applicationName='googleupdate.exe')
>>> event_query.and_(eventType='REGISTRY_ACCESS')
>>> event_query.and_(ownerNameExact='DevRel')
```

This query will search for Endpoint Standard Events created by the application `googleupdate.exe` accessing the registry on a device with a hostname containing `Win10`, an IP Address of `10.0.0.1`, and owned by `DevRel`.

Be Consistent When Refining Queries

All queries are of type *`QueryBuilder()`*, with support for either raw string-based queries , or keyword arguments.

```
# Equivalent queries
>>> string_query = api.select(platform.Device).where("avStatus:AV_ACTIVE")
>>> keyword_query = api.select(platform.Device).where(avStatus="AV_ACTIVE").
```

Queries must be consistent in their use of strings or keywords; do not mix strings and keywords.

```
# Not allowed
>>> mixed_query = api.select(platform.Device).where(avStatus='Win7x').and_(
↪"virtualMachine:true")
cbc_sdk.errors.ApiError: Cannot modify a structured query with a raw parameter
```

Execute a Query

A query is not executed on the server until it's accessed, either as an iterator (where it will generate results on demand as they're requested) or as a list (where it will retrieve the entire result set and save to a list).

```
# Create and Refine a query
>>> device_query = api.select(platform.Device).where('avStatus:AV_ACTIVE').set_os([
↪"WINDOWS"])

# Execute the query by accessing as a list
>>> matching_devices = [device for device in device_query]

>>> print(f"First matching device ID: {matching_devices[0].id}")
First matching device ID: 1234

# Or as an iterator
>>> for matching_device in device_query:
...   print(f"Matching device ID: {matching_device.id})
Matching device ID: 1234
Matching device ID: 5678
```

You can also call the Python built-in `len()` on this object to retrieve the total number of items matching the query.

```
# Retrieve total number of matching devices
>>> len(device_query)
2
```

In this example, the matching device ID's are accessed with `device.id`. If using Endpoint Standard Devices, the device ID's are accessed with `device.deviceId`.

Query Parameters vs Criteria

For queries, some Carbon Black Cloud APIs use `GET` requests with parameters, and some use `POST` requests with criteria.

Parameters

Parameters modify a query. When modifying a query with *`where()`*, *`and_()`*, and *`or_()`*, those modifications become query parameters when sent to Carbon Black Cloud.

```
>>> device_query = api.select(endpoint_standard.Device).where(hostName='Win7').and_
↪(ipAddress='10.0.0.1')
```

Executing this query results in an API call similar to `GET /integrationServices/v3/device?hostName='Win7'&ipAddress='10.0.0.1'`

Criteria

Criteria also modify a query, and can be used with or without parameters. When using CBC SDK, there are API-specific methods you can use to add criteria to queries.

```
# Create a query for alerts
>>> alert_query = api.select(cbc_sdk.Platform.Alert)

# Refine the query with parameters
>>> alert_query.where(alert_severity=9).or_(alert_severity=10)

# Refine the query with criteria
>>> alert_query.set_device_os(["MAC"]).set_device_os_versions(["10.14.6"])
```

Executing this query results in an API call to `POST /appservices/v6/orgs/{org_key}/alerts/_search` with this JSON Request Body:

```
{
  "query": "alert_severity:9 OR alert_severity:10",
  "criteria": {
    "device_os": ["MAC"],
    "device_os_version": ["10.14.6"]
  }
}
```

The query parameters are sent in `"query"`, and the criteria are sent in `"criteria"`.

Modules with Support for Criteria

Run

- *cbc_sdk.audit_remediation.base.RunQuery.device_ids()*
- *cbc_sdk.audit_remediation.base.RunQuery.device_types()*
- *cbc_sdk.audit_remediation.base.RunQuery.policy_id()*

`Event`

`Process`

Modules not yet Supported for Criteria

RunHistory

3.4.3 Asynchronous Queries

A number of queries allow for asynchronous mode of operation. Those utilize python futures and the request itself is performed in a separate worker thread. An internal thread pool is utilized to support multiple CBC queries executing in an asynchronous manner without blocking the main thread.

Execute an asynchronous query

Running asynchronous queries is done by invoking the `execute_async()` method, e.g:

```
>>> async_query = api.select(EnrichedEvent).where('process_name:chrome.exe').execute_
↪async()
```

The `execute_async()` method returns a python future object that can be later on waited for results.

Fetching asynchronous queries' results

Results from asynchronous queries can be retrieved by using the result() method since they are actually futures:

```
>>> print(async_query.result())
```

This would block the main thread until the query completes.

Modules with support for asynchronous queries

`Process`

`ProcessFacet`

`EnrichedEvent`

`EnrichedEventFacet`

`USBDeviceApprovalQuery`

`USBDeviceBlockQuery`

`USBDeviceQuery`

3.4.4 Facets

Facet search queries return statistical information indicating the relative weighting of the requested values as per the specified criteria. There are two types of criteria that can be set, one is the `range` type which is used to specify discrete values (integers or timestamps - specified both as seconds since epoch and also as ISO 8601 strings). The results are then grouped by occurence within the specified range. The other type is the `term` type which allow for one or more fields to use as a criteria on which to return weighted results.

Setting ranges

Ranges are configured via the `add_range()` method which accepts a dictionary of range settings or a list of range dictionaries:

```
>>> range = {
...                 "bucket_size": "+1DAY",
...                 "start": "2020-10-16T00:00:00Z",
...                 "end": "2020-11-16T00:00:00Z",
...                 "field": "device_timestamp"
...         }
>>> query = api.select(EnrichedEventFacet).where(process_pid=1000).add_range(range)
```

The range settings are as follows:

- `field` - the field to return the range for, should be a discrete one (integer or ISO 8601 timestamp)
- `start` - the value to begin grouping at
- `end` - the value to end grouping at
- `bucket_size`- how large of a bucket to group results in. If grouping an ISO 8601 property, use a string like '-3DAYS'

Multiple ranges can be configured per query by passing a list of range dictionaries.

Setting terms

Terms are configured via the `add_facet_field()` method:

```
>>> query = api.select(EnrichedEventFacet).where(process_pid=1000).add_facet_field(
↪"process_name")
```

The argument to add_facet_field method is the name of the field to be summarized.

Getting facet results

Facet results can be retrieved synchronously with the `.results` property, or asynchronously with the `.execute_async()` and `.result()` methods.

Create the query:

```
>>> event_facet_query = api.select(EventFacet).add_facet_field("event_type")
>>> event_facet_query.where(process_guid="WNEXFKQ7-00050603-0000066c-00000000-
↪1d6c9acb43e29bb")
>>> range = {
...                     "bucket_size": "+1DAY",
...                     "start": "2020-10-16T00:00:00Z",
...                     "end": "2020-11-16T00:00:00Z",
...                     "field": "device_timestamp"
...             }
>>> event_facet_query.add_range(range)
```

1. With the `.results` property:

```
>>> synchronous_results = event_facet_query.results
>>> print(synchronous_results)
EventFacet object, bound to https://defense-eap01.conferdeploy.net.
--------------------------------------------------------------------------------
↪-----
```

num_found: 16

processed_segments: 1

ranges: [{'start': '2020-10-16T00:00:00Z', 'end': '2020... terms: [{'values': [{'total': 14, 'id': 'modload', 'na...

total_segments: 1

2. With the `.execute_async()` and `.result()` methods:

```
>>> asynchronous_future = event_facet_query.execute_async()
>>> asynchronous_result = asynchronous_future.result()
>>> print(asynchronous_result)
EventFacet object, bound to https://defense-eap01.conferdeploy.net.
--------------------------------------------------------------------------------
↪-----
```

num_found: 16

processed_segments: 1

ranges: [{'start': '2020-10-16T00:00:00Z', 'end': '2020... terms: [{'values': [{'total': 14, 'id': 'modload', 'na...

total_segments: 1

The result for facet queries is a single object with two properties: `terms` and `ranges` that contain the facet search result weighted as per the criteria provided.

```
>>> print(synchronous_result.terms)
[{'values': [{'total': 14, 'id': 'modload', 'name': 'modload'}, {'total': 2, 'id':
↪'crossproc', 'name': 'crossproc'}], 'field': 'event_type'}]
>>> print(synchronous_result.ranges)
[{'start': '2020-10-16T00:00:00Z', 'end': '2020-11-16T00:00:00Z', 'bucket_size':
↪'+1DAY', 'field': 'device_timestamp', 'values': None}]
```

(continues on next page)

(continued from previous page)

Modules with support for facet searches

`ProcessFacet`

`EventFacet`

`EnrichedEventFacet`

3.4.5 Enriched Events

We can return the details for the enriched event for a specific event or we could return the details for all enriched events per alert.

Get details per event

```
>>> query = cb.select(EnrichedEvent).where(alert_category='THREAT')
>>> # get the first event returned by the query
>>> item = query[0]
>>> details = item.get_details()
>>> print(
    f'''
    Category: {details.alert_category}
    Type: {details.enriched_event_type}
    Alert Id: {details.alert_id}
    ''')
Category: ['THREAT'])
Type: CREATE_PROCESS
Alert Id: ['3F0D00A6']
```

Get details for all events per alert

```
# Alert information is accessible with Platform CBAnalyticsAlert
>>> api = CBCloudAPI(profile='platform')
>>> query = cb.select(CBAnalyticsAlert).set_create_time(range="-4w")
>>> # get the first alert returned by the query
>>> alert = query[0]
>>> for event in alert.get_events():
...   print(
      f'''
      Category: {event.alert_category}
      Type: {event.enriched_event_type}
      Alert Id: {event.alert_id}
      ''')
Category: ['OBSERVED']
Type: SYSTEM_API_CALL
Alert Id: ['BE084638']

Category: ['OBSERVED']
Type: NETWORK
Alert Id: ['BE084638']
```

3.5 Guides and Resources

Here we've listed a collection of tutorials, recorded demonstrations and other resources we think will be useful to get the most out of the Carbon Black Cloud Python SDK.

3.5.1 Recordings

Demonstrations are found on our YouTube channel.

A recent highlight shows how to schedule Audit and Remediation Tasks.

3.5.2 Guides

- device-control - Control the blocking of USB devices on endpoints.
- workload - Advanced protection purpose-built for securing modern workloads to reduce the attack surface and strengthen security posture.
- reputation-override - Manage reputation overrides for known applications, IT tools or certs.
- live-response - Live Response allows security operators to collect information and take action on remote endpoints in real time.
- unified-binary-store - The unified binary store (UBS) is responsible for storing all binaries and corresponding metadata for those binaries.
- users-grants - Work with users and access grants.
- watchlists-feeds-reports - Work with Enterprise EDR watchlists, feeds, reports, and Indicators of Compromise (IOCs).

3.5.3 Examples

The GitHub repository also has some example scripts which will help you get started using the SDK.

3.6 Porting Applications from CBAPI to Carbon Black Cloud SDK

This guide will help you migrate from CBAPI to the Carbon Black Cloud Python SDK.

Note: CBAPI applications using Carbon Black EDR (Response) or Carbon Black App Control (Protection) cannot be ported, as support for on-premise products is not present in the CBC SDK. Continue to use CBAPI for these applications.

3.6.1 Overview

CBC SDK has changes to package names, folder structure, and functions. Import statements will need to change for the packages, modules, and functions listed in this guide.

3.6.2 Package Name Changes

A number of packages have new name equivalents in the CBC SDK. Endpoint Standard and Enterprise EDR have had parts replaced to use the most current API routes.

Top-level Package Name Change

The top-level package name has changed from CBAPI to CBC SDK.

CBAPI Name (old)	CBC SDK Name (new)
cbapi.psc	cbc_sdk

Product Name Changes

Carbon Black Cloud product names have been updated in the SDK.

CBAPI Name (old)	CBC SDK Name (new)
cbapi.psc.defense	cbc_sdk.endpoint_standard
cbapi.psc.livequery	cbc_sdk.audit_remediation
cbapi.psc.threathunter	cbc_sdk.enterprise_edr
cbapi.psc	cbc_sdk.platform

Import statements will need to change:

```
# Endpoint Standard (Defense)

# CBAPI
from cbapi.psc.defense import Device, Event, Policy

# CBC SDK
from cbc_sdk.endpoint_standard import Device, Event, Policy
```

```
# Audit and Remediation (LiveQuery)

# CBAPI
from cbapi.psc.livequery import Run, RunHistory, Result, DeviceSummary

# CBC SDK
from cbc_sdk.audit_remediation import Run, RunHistory, Result, DeviceSummary
```

```
# Enterprise EDR (ThreatHunter)

# CBAPI
from cbapi.psc.threathunter import Feed, Report, Watchlist

# CBC SDK
from cbc_sdk.enterprise_edr import Feed, Report, Watchlist
```

Moved Packages and Models

Some modules have been moved to a more appropriate location.

CBAPI Name (old)	CBC SDK Name (new)
cbapi.example_helpers	cbc_sdk.helpers
cbapi.psc.alerts_query	cbc_sdk.platform
cbapi.psc.devices_query	cbc_sdk.platform

Import statements will need to change:

```
# Example Helpers

# CBAPI
from cbapi.example_helpers import build_cli_parser

# CBC SDK
from cbc_sdk.helpers import build_cli_parser
```

```
# Alerts

# CBAPI
from cbapi.psc.alerts_query import *

# CBC SDK
from cbc_sdk.platform import *
```

```
# Devices

# CBAPI
from cbapi.psc.devices_query import *

# CBC SDK
from cbc_sdk.platform import *
```

Replaced Modules

With the new Unified Platform Experience, Carbon Black Cloud APIs have been updated to provide a more consistent search experience. Platform search is replacing Endpoint Standard Event searching, and Enterprise EDR Process and Event searching.

For help beyond import statement changes, check out these resources:

- Unified Platform Experience: What to Expect
- Migration Guide: Carbon Black Cloud Events API
- Advanced Search Tips for Carbon Black Cloud Platform Search

Endpoint Standard

Endpoint Standard Events are being replaced with Enriched Events.

```
# Endpoint Standard Enriched Events

# CBAPI
from cbapi.psc.defense import Event

# CBC SDK
from cbc_sdk.endpoint_standard import EnrichedEvent
```

Enterprise EDR

Enterprise EDR Processes and Events have been removed and replaced with Platform Processes and Events.

```
# Enterprise EDR Process and Event

# CBAPI
from cbapi.psc.threathunter import Process, Event

# CBC SDK
from cbc_sdk.platform import Process, Event
```

3.6.3 Folder Structure Changes

The directory structure for the SDK has been refined compared to CBAPI.

- Addition of the Platform folder
- Removal of Response and Protection folders
- Consolidation of model objects and query objects
- Product-specific `rest_api.py` files replaced with package level `rest_api.py`
  - `from cbapi.psc.threathunter import CbThreatHunterAPI` becomes `from cbc_sdk import CBCloudAPI`, etc.

Directory Tree Changes

In general, each module's `models.py` and `query.py` files were combined into their respective `base.py` files.

CBAPI had the following abbreviated folder structure:

```
src
└── cbapi
    └── psc
        ├── defense
        │   ├── models.py
        │   │   ├── Device
        │   │   ├── Event
        │   │   └── Policy
        │   └── rest_api.py
        │       └── CbDefenseAPI
        ├── livequery
        │   ├── models.py
        │   │   ├── Run
        │   │   ├── RunHistory
        │   │   ├── Result
        │   │   ├── ResultFacet
        │   │   ├── DeviceSummary
        │   │   └── DeviceSummaryFacet
        │   └── rest_api.py
        │       └── CbLiveQueryAPI
        └── threathunter
            ├── models.py
            │   ├── Process
            │   ├── Event
            │   ├── Tree
            │   ├── Feed
            │   ├── Report
            │   ├── IOC
```

(continues on next page)

(continued from previous page)

```
│   ├── IOC_V2
│   ├── Watchlist
│   ├── ReportSeverity
│   ├── Binary
│   └── Downloads
└── rest_api.py
    └── CbThreatHunterAPI
```

Each product had a `models.py` and `rest_api.py` file.

CBC SDK has the following abbreviated folder structure:

```
src
└── cbc_sdk
    ├── audit_remediation
    │   └── base.py
    │       ├── Run
    │       ├── RunHistory
    │       ├── Result
    │       ├── ResultFacet
    │       ├── DeviceSummary
    │       └── DeviceSummaryFacet
    ├── endpoint_standard
    │   └── base.py
    │       ├── Device
    │       ├── Event
    │       ├── Policy
    │       ├── EnrichedEvent
    │       └── EnrichedEventFacet
    ├── enterprise_edr
    │   ├── base.py
    │   ├── threat_intelligence.py
    │   │   ├── Watchlist
    │   │   ├── Feed
    │   │   ├── Report
    │   │   ├── ReportSeverity
    │   │   ├── IOC
    │   │   └── IOC_V2
    │   └── ubs.py
    │       ├── Binary
    │       └── Downloads
    └── platform
    │   ├── alerts.py
    │   │   ├── WatchlistAlert
    │   │   ├── CBAnalyticsAlert
    │   │   ├── Workflow
    │   │   └── WorkflowStatus
    │   ├── processes.py
    │   │   ├── Process
    │   │   └── ProcessFacet
    │   ├── events.py
    │   │   ├── Event
    │   │   └── EventFacet
    │   └── devices.py
    │       └── Device
    └── rest_api.py
        └── CBCloudAPI.py
```

Now, each product has either a `base.py` file with all of its objects, or categorized files like `platform.alerts.py` and `platform.devices.py`. The package level `rest_api.py` replaced each product-specific `rest_api.py` file.

3.6.4 Function Changes

Helper Functions:

CBAPI Name (old)	CBC SDK Name (new)

`cbapi.example_helpers.get_cb_defense_object()`
`example_helpers.get_cb_livequery_object()`
`example_helpers.get_cb_threathunter_object()`
`example_helpers.get_cb_psc_object()`
	`cbapi.`
	`cbapi.`
	`cbapi.`
		`cbc_sdk.`
		`helpers.`
		`get_cb_cloud_object()`

Audit and Remediation Queries:

CBAPI Name (old)	CBC SDK Name (new)
`cb.query(sql_query)`	`cb.select(Run).where(sql=sql_query)`
`cb.query_history(query_string)`	`cb.select(RunHistory).where(query_string)`
`cb.query(sql_query).policy_ids()`	`cb.select(Run).policy_id()`

API Objects:

CBAPI Name (old)	CBC SDK Name (new)
`cbapi.psc.defense.CbDefenseAPI` `cbapi.psc.livequery.CbLiveQueryAPI` `cbapi.psc.threathunter.CbThreatHunterAPI` `cbapi.psc.CbPSCBaseAPI`	`cbc_sdk.` `CBCloudAPI`

3.7 Logging & Diagnostics

The cbc_sdk provides extensive logging facilities to track down issues communicating with the REST API and understand potential performance bottlenecks.

3.7.1 Enabling Logging

The cbc_sdk uses Python's standard `logging` module for logging. To enable debug logging for the cbc_sdk, you can do the following:

```
>>> import logging
>>> logging.basicConfig(level=logging.DEBUG)
```

All REST API calls, including the API endpoint, any data sent via POST or PUT, and the time it took for the call to complete:

```
>>> devices = [ device for device in cb.select(Device) ]
DEBUG:cbc_sdk.connection:Sending HTTP POST /appservices/v6/orgs/ABCD1234/devices/_
↪search with {"criteria": {}, "exclusions": {}, "query": ""}
DEBUG:urllib3.connectionpool:Starting new HTTPS connection (1): defense-eap01.
↪conferdeploy.net:443
```

(continues on next page)

(continued from previous page)

```
DEBUG:urllib3.connectionpool:https://defense-eap01.conferdeploy.net:443 "POST /
↪appservices/v6/orgs/ABCD1234/devices/_search HTTP/1.1" 200 None
DEBUG:cbc_sdk.connection:HTTP POST /appservices/v6/orgs/ABCD1234/devices/_search took␣
↪0.409s (response 200)
```

3.8 Testing

This document will provide information about how to run the functional tests for the CBC Python SDK in Linux and Windows platforms.

These instructions assume you already have the CBC SDK sources present locally. If not, they can be checked out from GitHub using the URL https://github.com/carbonblack/carbon-black-cloud-sdk-python; doing so will require you to either have Git installed or download the source tree packed as a zip archive from GitHub and then unarchive it.

3.8.1 Running the tests on Microsoft Windows

Install Python

From http://python.org, download the installer for the most recent Python 3.8 version (as of this writing, version 3.8.6 is the latest).

Fix the Execution PATH

Go to the Environment Variables dialog (System Control Panel or Properties page for My Computer/This PC, then select **Advanced system settings** and then the **Environment Variables** button). Ensure that the first two components of the user PATH environment variable are *%USERPROFILE%\AppData\Local\Programs\Python\Python38* and *%USERPROFILE%\AppData\Local\Programs\Python\Python38\Scripts*.

To test this, open a command window and use the command: `python --version`

It should run Python and show that you are running Python 3.8.

Install CBC Python SDK Requirements

From the top-level CBC SDK source directory, execute the following commands:

```
pip install -r requirements.txt
```

This will ensure that all required python modules are installed.

Execute the Functional Tests

From the top-level CBC SDK source directory, execute the following command:

```
pytest
```

The tests should return that they all completed successfully.

3.8.2 Running the tests on Linux

Carbon Black Cloud Python SDK provides a number of Dockerfiles inside the docker folder of the source root. Those contain the necessary instructions to build docker images containing a number of distributions with CBC Python SDK preinstalled in /app directory (relative to image root).

Build the docker image

Currently the following Dockerfiles are available:

- docker/amazon/Dockerfile - Amazon Linux (latest) image
- docker/ubuntu/Dockerfile - Ubuntu 18.04 image
- docker/rhel/Dockerfile - RHEL8 UBI image
- docker/suse/Dockerfile - OpenSUSE Leap (latest) image

Building the images should be done from the CBC SDK root directory by explicitly providing the path to the Dockerfile to be built, e.g for the RHEL one, the build command would be:

```
docker build -t cbc-sdk-python=rhel -f docker/rhel/Dockerfile .
```

By default, the docker Unix socket is owned by root user / docker group. In case you are running the build as a non-root user that isn't member of docker group, sudo should be used:

```
sudo docker build -t cbc-sdk-python-rhel -f docker/rhel/Dockerfile .
```

Run the container and execute the test

When the docker image builds, it should be started, e.g:

```
docker run -it cbc-sdk-python-rhel
```

This will run the container and spawn an interactive shell running in it. CBC Python SDK is installed in the /app directory, so pytest needs to be executed from there:

```
cd /app && pytest
```

3.9 Changelog

3.9.1 CBC SDK 1.3.3 - Released August 10, 2021

Bug Fixes:

- Dependency fix on schema library.

3.9.2 CBC SDK 1.3.2 - Released August 10, 2021

New Features:

- Added asynchronous query options to Live Response APIs.
- Added functionality for Watchlists, Reports, and Feeds to simplify developer interaction.

Updates:

- Added documentation on the mapping between permissions and Live Response commands.

Bug Fixes:

- Fixed an error using the STIX/TAXII example with Cabby.
- Fixed a potential infinite loop in getting detailed search results for enriched events and processes.
- Comparison now case-insensitive on UBS download.

3.9.3 CBC SDK 1.3.1 - Released June 15, 2021

New Features:

- Allow the SDK to accept a pre-configured `Session` object to be used for access, to get around unusual configuration requirements.

Bug Fixes:

- Fix functions in `Grant` object for adding a new access profile to a user access grant.

3.9.4 CBC SDK 1.3.0 - Released June 8, 2021

New Features

- Add User Management, Grants, Access Profiles, Permitted Roles
- Move Vulnerability models to Platform package in preparation for supporting Endpoints and Workloads
- Refactor Vulnerability models
  - `VulnerabilitySummary.get_org_vulnerability_summary` static function changed to `Vulnerability.OrgSummary` model with query class
  - `VulnerabilitySummary` model moved inside `Vulnerability` to `Vulnerability.AssetView` sub model
  - `OrganizationalVulnerability` and `Vulnerability` consolidated into a single model to include Carbon Black Cloud context and CVE information together
  - `Vulnerability(cb, CVE_ID)` returns Carbon Black Cloud context and CVE information
  - `DeviceVulnerability.get_vulnerability_summary_per_device` static function moved to `get_vulnerability_summary` function on `Device` model
  - `affected_assets(os_product_id)` function changed to `get_affected_assets()` function and no longer requires `os_product_id`
- Add dashboard export examples
- Live Response migrated from v3 to v6 (migration guide)
  - Live Response uses API Keys of type Custom
- Add function to get Enriched Events for Alert

Bug Fixes

- Fix validate query from dropping sort_by for Query class
- Fix the ability to set expiration for binary download URL
- Fix bug in helpers read_iocs functionality
- Fix install_sensor and bulk_install on ComputeResource to use id instead of uuid
- Fix DeviceSearchQuery from duplicating Device due to base index of 1

3.9.5 CBC SDK 1.2.3 - Released April 19, 2021

Bug Fixes

- Prevent alert query from retrieving past 10k limit

3.9.6 CBC SDK 1.2.3 - Released April 19, 2021

Bug Fixes

- Prevent alert query from retrieving past 10k limit

3.9.7 CBC SDK 1.2.2 - Released April 5, 2021

Bug Fixes

- Add support for full credential property loading through BaseAPI constructor

3.9.8 CBC SDK 1.2.1 - Released March 31, 2021

New Features

- Add *__str__* functions for Process.Tree and Process.Summary
- Add *get_details* for Process
- Add *set_max_rows* to DeviceQuery

Bug Fixes

- Modify base class for EnrichedEventQuery to Query from cbc_sdk.base to support entire feature set for searching
- Document fixes for changelog and Workload
- Fix *_spawn_new_workers* to correctly find active devices for Carbon Black Cloud

3.9.9 CBC SDK 1.2.0 - Released March 9, 2021

New Features

- VMware Carbon Black Cloud Workload support for managing workloads:
  - Vulnerability Assessment
  - Sensor Lifecycle Management
  - VM Workloads Search
- Add tutorial for Reputation Override

Bug Fixes

- Fix to initialization of ReputationOverride objects

3.9.10 CBC SDK 1.1.1 - Released February 2, 2021

New Features

- Add easy way to add single approvals and blocks
- Add Device Control Alerts
- Add deployment_type support to the Device model

Bug Fixes

- Fix error when updating iocs in a Report model
- Set max_retries to None to use Connection init logic for retries

3.9.11 CBC SDK 1.1.0 - Released January 27, 2021

New Features

- Reputation Overrides for Endpoint Standard with Enterprise EDR support coming soon
- Device Control for Endpoint Standard
- Live Query Templates/Scheduled Runs and Template History
- Add set_time_range for Alert query

Bug Fixes

- Refactored code base to reduce query inheritance complexity
- Limit Live Query results to 10k cap to prevent 400 Bad Request
- Add missing criteria for Live Query RunHistory to search on template ids
- Add missing args.orgkey to get_cb_cloud_object to prevent exception from being thrown
- Refactor add and update criteria to use CriteriaBuilderSupportMixin

3.9.12 CBC SDK 1.0.1 - Released December 17, 2020

Bug Fixes

- Fix readme links
- Few ReadTheDocs fixes

3.9.13 CBC SDK 1.0.0 - Released December 16, 2020

New Features

- Enriched Event searches for Endpoint Standard
- Aggregation search added for Enriched Event Query
- Add support for fetching additional details for an Enriched Event
- Facet query support for Enriched Events, Processes, and Process Events
- Addition of Python Futures to support asynchronous calls for customers who want to leverage that feature , while continuing to also provide the simplified experience which hides the multiple calls required.

- Added translation support for MISP threat intel to cbc_sdk threat intel example

Updates

- Improved information and extra calls for Audit and Remediation (Live Query)
- Great test coverage – create extensions and submit PRs with confidence
- Process and Process Event searches updated to latest APIs and moved to platform package
- Flake8 formatting applied to all areas of the code
- Converted old docstrings to use google format docstrings
- Migrated STIX/TAXII Threat Intel module from cbapi to cbc_sdk examples

Bug Fixes

- Fixed off by one error for process event pagination
- Added support for default profile using CBCloudAPI()
- Retry limit to Process Event search to prevent infinite loop

CHAPTER 4

Full SDK Documentation

See detailed information on the objects and methods exposed by the Carbon Black Cloud Python SDK here.

4.1 Audit and Remediation

4.1.1 Submodules

4.1.2 cbc_sdk.audit_remediation.base module

Model and Query Classes for Audit and Remediation

class DeviceSummary(*cb*, *initial_data*)

Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a DeviceSummary object in the Carbon Black server.

Variables

- ***id*** – The result's unique ID
- ***total_results*** – Number of results returned for this particular device
- ***device*** – Information associated with the device
- ***time_received*** – The time at which this result was received
- ***status*** – The result's status
- ***device_message*** – Placeholder
- ***metrics*** – Metrics associated with the device

Initialize a DeviceSummary object with initial_data.

class Metrics(*cb*, *initial_data*)

Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Metrics object in the Carbon Black server.

Initialize a DeviceSummary Metrics object with initial_data.

device = {}

device_message = None

id = None

metrics = []

metrics_
Returns the reified *DeviceSummary.Metrics* for this result.

primary_key = 'device_id'

status = None

time_received = None

total_results = None

urlobject = '/livequery/v1/orgs/{}/runs/{}/results/device_summaries/_search'

class DeviceSummaryFacet(*cb*, *initial_data*)
Bases: *cbc_sdk.audit_remediation.base.ResultFacet*

Represents a DeviceSummaryFacet object in the Carbon Black server.

Initialize a DeviceSummaryFacet object with initial_data.

urlobject = '/livequery/v1/orgs/{}/runs/{}/results/device_summaries/_facet'

class FacetQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*

Represents a query that receives facet information from a LiveQuery run.

Initialize a FacetQuery object.

facet_field(*field*)
Sets the facet fields to be received by this query.

Parameters **field** (*str or [str]*) – Field(s) to be received.

Returns FacetQuery that will receive field(s) facet_field.

Example:

```
>>> cb.select(ResultFacet).run_id(my_run).facet_field(["device.policy_name",
↪"device.os"])
```

run_id(*run_id*)
Sets the run ID to query results for.

Parameters **run_id** (*int*) – The run ID to retrieve results for.

Returns FacetQuery object with specified run_id.

Example: >>> cb.select(ResultFacet).run_id(my_run)

set_device_ids(*device_ids*)
Sets the device.id criteria filter.

Parameters **device_ids** (*[int]*) – Device IDs to filter on.

Returns The FacetQuery with specified device.id.

set_device_names(*device_names*)
Sets the device.name criteria filter.

Parameters **device_names** (*[str]*) – Device names to filter on.

Returns The FacetQuery with specified device.name.

set_device_os(*device_os*)
Sets the device.os criteria.

Parameters **device_os** (*[str]*) – Device OS's to filter on.

Returns The FacetQuery object with specified device_os.

Note: Device OS's can be one or more of ["WINDOWS", "MAC", "LINUX"].

---

set_policy_ids(*policy_ids*)
Sets the device.policy_id criteria.

Parameters **policy_ids** (*[int]*) – Device policy ID's to filter on.

Returns The FacetQuery object with specified policy_ids.

set_policy_names(*policy_names*)
Sets the device.policy_name criteria.

Parameters **policy_names** (*[str]*) – Device policy names to filter on.

Returns The FacetQuery object with specified policy_names.

set_statuses(*statuses*)
Sets the status criteria.

Parameters **statuses** (*[str]*) – Query statuses to filter on.

Returns The FacetQuery object with specified statuses.

MAX_RESULTS_LIMIT = 10000
Audit and Remediation Models

class Result(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Result object in the Carbon Black server.

Variables

- ***id*** – The result's unique ID
- ***device*** – The device associated with the result
- ***status*** – The result's status
- ***time_received*** – The time at which this result was received
- ***device_message*** – Placeholder
- ***fields*** – The fields returned by the backing osquery query
- ***metrics*** – Metrics associated with the result's host

Initialize a Result object with initial_data.

Device, Fields, and Metrics objects are attached using initial_data.

class Device(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Device object in the Carbon Black server.

Initialize a Device Result object with initial_data.

primary_key = 'id'

class Fields(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Fields object in the Carbon Black server.

Initialize a Result Fields object with initial_data.

class Metrics(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Metrics object in the Carbon Black server.

Initialize a Result Metrics object with initial_data.

device = {}

device_
Returns the reified *Result.Device* for this result.

device_message = None

fields = {}

fields_
Returns the reified *Result.Fields* for this result.

id = None

metrics = {}

metrics_
Returns the reified *Result.Metrics* for this result.

primary_key = 'id'

query_device_summaries()
Returns a ResultQuery for a DeviceSummary.

This represents the search for a summary of results from a single device of a *Run*.

query_device_summary_facets()
Returns a ResultQuery for a DeviceSummaryFacet.

This represents the search for a summary of a single device summary of a *Run*.

query_result_facets()
Returns a ResultQuery for a ResultFacet.

This represents the search for a summary of results from a single field of a *Run*.

status = None

time_received = None

urlobject = '/livequery/v1/orgs/{}/runs/{}/results/_search'

class ResultFacet(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a ResultFacet object in the Carbon Black server.

Variables ***field*** – The name of the field being summarized

Initialize a ResultFacet object with initial_data.

class Values(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Values object in the Carbon Black server.

Initialize a ResultFacet Values object with initial_data.

field = None

primary_key = 'field'

urlobject = '/livequery/v1/orgs/{}/runs/{}/results/_facet'

values = []

values_
Returns the reified *ResultFacet.Values* for this result.

class ResultQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*

Represents a query that retrieves results from a LiveQuery run.

Initialize a ResultQuery object.

run_id(*run_id*)
Sets the run ID to query results for.

Parameters **run_id** (*int*) – The run ID to retrieve results for.

Returns ResultQuery object with specified run_id.

Example:

```
>>> cb.select(Result).run_id(my_run)
```

set_device_ids(*device_ids*)
Sets the device.id criteria filter.

Parameters **device_ids** (*[int]*) – Device IDs to filter on.

Returns The ResultQuery with specified device.id.

set_device_names(*device_names*)
Sets the device.name criteria filter.

Parameters **device_names** (*[str]*) – Device names to filter on.

Returns The ResultQuery with specified device.name.

set_device_os(*device_os*)
Sets the device.os criteria.

Parameters **device_os** (*[str]*) – Device OS's to filter on.

Returns The ResultQuery object with specified device_os.

Note: Device OS's can be one or more of ["WINDOWS", "MAC", "LINUX"].

set_policy_ids(*policy_ids*)
Sets the device.policy_id criteria.

Parameters **policy_ids** ([int]) – Device policy ID's to filter on.

Returns The ResultQuery object with specified policy_ids.

set_policy_names(*policy_names*)
Sets the device.policy_name criteria.

Parameters **policy_names** ([str]) – Device policy names to filter on.

Returns The ResultQuery object with specified policy_names.

set_statuses(*statuses*)
Sets the status criteria.

Parameters **statuses** ([str]) – Query statuses to filter on.

Returns The ResultQuery object with specified statuses.

sort_by(*key*, *direction='ASC'*)
Sets the sorting behavior on a query's results.

Parameters

- **key** (*str*) – The key in the schema to sort by.
- **direction** (*str*) – The sort order, either "ASC" or "DESC".

Returns ResultQuery object with specified sorting key and order.

Example:

```
>>> cb.select(Result).run_id(my_run).where(username="foobar").sort_by("uid")
```

class Run(*cb*, *model_unique_id=None*, *initial_data=None*)
Bases: *cbc_sdk.base.NewBaseModel*

Represents a Run object in the Carbon Black server.

Variables

- ***org_key*** – The organization key for this run
- ***name*** – The name of the Audit and Remediation run
- ***id*** – The run's unique ID
- ***sql*** – The Audit and Remediation query
- ***created_by*** – The user or API id that created the run
- ***create_time*** – When this run was created
- ***status_update_time*** – When the status of this run was last updated
- ***timeout_time*** – The time at which the query will stop requesting results from any devices who have not responded
- ***cancellation_time*** – The time at which a user or API id cancelled the run
- ***cancelled_by*** – The user or API id that cancelled the run
- ***notify_on_finish*** – Whether or not to send an email on query completion
- ***active_org_devices*** – The number of devices active in the organization
- ***status*** – The run status

- ***device_filter*** – Any device filter rules associated with the run
- ***last_result_time*** – When the most recent result for this run was reported
- ***total_results*** – The number of results received
- ***match_count*** – The number of devices which received a match to the query
- ***no_match_count*** – The number of devices which did not received a match to the query
- ***error_count*** – The number of devices which errored
- ***not_supported_count*** – The number of devices which do not support a portion of the osquery
- ***cancelled_count*** – The number of devices which were cancelled before they ran the query
- ***not_started_count*** – The number of devices which have not run the query
- ***success_count*** – The number of devices which succeeded in running the query
- ***in_progress_count*** – The number of devices which were currently executing the query
- ***recommended_query_id*** – The id of a query from the recommendedation route
- ***template_id*** – The template that created the run

Initialize a Run object with initial_data.

active_org_devices = None

cancellation_time = None

cancelled_by = None

cancelled_count = None

create_time = None

created_by = None

delete()

Delete a query.

Returns True if the query was deleted successfully, False otherwise.

Return type (bool)

device_filter = {}

error_count = None

id = None

in_progress_count = None

last_result_time = None

match_count = None

name = None

no_match_count = None

not_started_count = None

not_supported_count = None

notify_on_finish = None

org_key = None

primary_key = 'id'

recommended_query_id = None

schedule = {}

sql = None

status = None

status_update_time = None

stop()
Stop a running query.

Returns True if query was stopped successfully, False otherwise.

Return type (bool)

Raises `ServerError` – If the server response cannot be parsed as JSON.

success_count = None

template_id = None

timeout_time = None

total_results = None

urlobject = '/livequery/v1/orgs/{}/runs'

urlobject_single = '/livequery/v1/orgs/{}/runs/{}'

class RunHistory(*cb*, *initial_data=None*)
Bases: *cbc_sdk.audit_remediation.base.Run*

Represents a RunHistory object in the Carbon Black server.

Initialize a RunHistory object with initial_data.

urlobject_history = '/livequery/v1/orgs/{}/runs/_search'

class RunHistoryQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*

Represents a query that retrieves historic LiveQuery runs.

Initialize a RunHistoryQuery object.

set_template_ids(*template_ids*)
Sets the template_id criteria filter.

Parameters **template_ids** (*[str]*) – Template IDs to filter on.

Returns The ResultQuery with specified template_id.

sort_by(*key*, *direction='ASC'*)
Sets the sorting behavior on a query's results.

Parameters

- **key** (*str*) – The key in the schema to sort by.
- **direction** (*str*) – The sort order, either "ASC" or "DESC".

Returns RunHistoryQuery object with specified sorting key and order.

Example:

```
>>> cb.select(Result).run_id(my_run).where(username="foobar").sort_by("uid")
```

class RunQuery(*doc_class*, *cb*)

Bases: *cbc_sdk.base.BaseQuery*

Represents a query that either creates or retrieves the status of a LiveQuery run.

Initialize a RunQuery object.

device_ids(*device_ids*)

Restricts the devices that this Audit and Remediation run is performed on to the given IDs.

Parameters **device_ids** (*[int]*) – Device IDs to perform the Run on.

Returns The RunQuery with specified device_ids.

device_types(*device_types*)

Restricts the devices that this Audit and Remediation run is performed on to the given OS.

Parameters **device_types** (*[str]*) – Device types to perform the Run on.

Returns The RunQuery object with specified device_types.

Note: Device type can be one of [“WINDOWS”, “MAC”, “LINUX”].

---

name(*name*)

Sets this Audit and Remediation run’s name.

If no name is explicitly set, the run is named after its SQL.

Parameters **name** (*str*) – The name for this Run.

Returns The RunQuery object with specified name.

notify_on_finish()

Sets the notify-on-finish flag on this Audit and Remediation run.

Returns The RunQuery object with *notify_on_finish* set to True.

policy_id(*policy_id*)

Restricts this Audit and Remediation run to the given policy ID.

Parameters **policy_id** (*int) or (list[int]*) – Policy ID to perform the Run on.

Returns The RunQuery object with specified policy_id.

schedule(*rrule*, *timezone*)

Sets a schedule for the SQL Query to recur

A schedule requires an rrule and a timezone to determine the time to rerun the SQL query. rrule is defined in RFC 2445 however only a subset of the functionality is supported here. If a Run is created with a schedule then the Run will contain a template_id to the corresponding template and a new Run will be created each time the schedule is met.

Example RRule:

DAILY

Field | Values |

——— | ——- |
BYSECOND | 0 |
BYMINUTE | 0 or 30 |
BYHOUR | 0 to 23 |

Daily at 1:30PM RRULE:FREQ=DAILY;BYHOUR=13;BYMINUTE=30;BYSECOND=0

WEEKLY

Field | Values |
——— | ——————————— |
BYSECOND | 0 |
BYMINUTE | 0 or 30 |
BYHOUR | 0 to 23 |
BYDAY | One or more: SU, MO, TU, WE, TH, FR, SA |

Monday and Friday of the week at 2:30 AM RRULE:FREQ=WEEKLY;BYDAY=MO,FR;BYHOUR=13;BYMINUTE

MONTHLY

Note: Either (BYDAY and BYSETPOS) or BYMONTHDAY is required.

Field | Values |
———— | ——————————— |
BYSECOND | 0 |
BYMINUTE | 0 or 30 |
BYHOUR | 0 to 23 |
BYDAY | One or more: SU, MO, TU, WE, TH, FR, SA |
BYSETPOS | -1, 1, 2, 3, 4 |
BYMONTHDAY | One or more: 1 to 28 |

Last Monday of the Month at 2:30 AM RRULE:FREQ=MONTHLY;BYDAY=MO;BYSETPOS=-1;BYHOUR=2;BYMINUTE=30;BYSECOND=0

1st and 15th of the Month at 2:30 AM RRULE:FREQ=DAILY;BYMONTHDAY=1,15;BYHOUR=2;BYMINUTE=30;

Parameters

- **rrule** (*string*) – A recurrence rule (RFC 2445) specifying the frequency and time at which the query will recur
- **timezone** (*string*) – The timezone database name to use as a base for the rrule

Returns The RunQuery with a recurrence schedule.

submit()

Submits this Audit and Remediation run.

Returns A new *Run* instance containing the run's status.

Raises ApiError – If the Run does not have SQL set, or if the Run has already been submitted.

where(*sql*)
Sets this Audit and Remediation run's underlying SQL.

Parameters **sql** (*str*) – The SQL to execute for the Run.

Returns The RunQuery object with specified sql.

class Template(*cb*, *model_unique_id=None*, *initial_data=None*)
Bases: *cbc_sdk.audit_remediation.base.Run*

Represents a Template object in the Carbon Black server.

Variables

- ***org_key*** – The organization key for this run
- ***name*** – The name of the Audit and Remediation run
- ***id*** – The run's unique ID
- ***sql*** – The Audit and Remediation query
- ***created_by*** – The user or API id that created the run
- ***create_time*** – When this run was created
- ***status_update_time*** – When the status of this run was last updated
- ***timeout_time*** – The time at which the query will stop requesting results from any devices who have not responded
- ***cancellation_time*** – The time at which a user or API id cancelled the run
- ***cancelled_by*** – The user or API id that cancelled the run
- ***archive_time*** – The time at which a user or API id cancelled the run
- ***archived_by*** – The user or API id that archived the run
- ***notify_on_finish*** – Whether or not to send an email on query completion
- ***active_org_devices*** – The number of devices active in the organization
- ***status*** – The run status
- ***device_filter*** – Any device filter rules associated with the run
- ***last_result_time*** – When the most recent result for this run was reported
- ***total_results*** – The number of results received
- ***match_count*** – The number of devices which received a match to the query
- ***no_match_count*** – The number of devices which did not received a match to the query
- ***error_count*** – The number of devices which errored
- ***not_supported_count*** – The number of devices which do not support a portion of the osquery
- ***cancelled_count*** – The number of devices which were cancelled before they ran the query
- ***not_started_count*** – The number of devices which have not run the query
- ***success_count*** – The number of devices which succeeded in running the query
- ***in_progress_count*** – The number of devices which were currently executing the query

- ***recommended_query_id*** – The id of a query from the recommendedation route
- ***template_id*** – The template that created the run

Initialize a Template object with initial_data.

active_org_devices = None

archive_time = None

archived_by = None

cancellation_time = None

cancelled_by = None

cancelled_count = None

create_time = None

created_by = None

device_filter = {}

error_count = None

id = None

in_progress_count = None

last_result_time = None

match_count = None

name = None

no_match_count = None

not_started_count = None

not_supported_count = None

notify_on_finish = None

org_key = None

primary_key = 'id'

recommended_query_id = None

schedule = {}

sql = None

status = None

status_update_time = None

stop()

Stop a template.

Returns True if query was stopped successfully, False otherwise.

Return type (bool)

Raises `ServerError` – If the server response cannot be parsed as JSON.

success_count = None

template_id = None

timeout_time = None

total_results = None

urlobject = '/livequery/v1/orgs/{}/templates'

urlobject_single = '/livequery/v1/orgs/{}/templates/{}'

class TemplateHistory(*cb*, *initial_data=None*)

Bases: *cbc_sdk.audit_remediation.base.Template*

Represents a TemplateHistory object in the Carbon Black server.

Initialize a TemplateHistory object with initial_data.

urlobject_history = '/livequery/v1/orgs/{}/templates/_search'

class TemplateHistoryQuery(*doc_class*, *cb*)

Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*

Represents a query that retrieves historic LiveQuery templates.

Initialize a TemplateHistoryQuery object.

sort_by(*key*, *direction='ASC'*)

Sets the sorting behavior on a query's results.

Parameters

- **key** (*str*) – The key in the schema to sort by.
- **direction** (*str*) – The sort order, either "ASC" or "DESC".

Returns RunHistoryQuery object with specified sorting key and order.

Example:

```
>>> cb.select(Result).run_id(my_run).where(username="foobar").sort_by("uid")
```

4.1.3 Module contents

4.2 Credential Providers

4.2.1 Submodules

4.2.2 cbc_sdk.credential_providers.default module

Function which gives us the default credentials handler for use by CBCloudAPI.

class DefaultProvider

Bases: object

Intermediate class defined to allow insertion of a "test point" into default_credential_provider().

get_default_provider(*credential_file*)

Return the default credential provider that CBCloudAPI should use.

Parameters **credential_file** (*str*) – Credential file as specified to the initialization of the API.

Returns The default credential provider that CBCloudAPI should use.

Return type *CredentialProvider*

default_credential_provider(*credential_file*)
Return the default credential provider that CBCloudAPI should use.

Parameters **credential_file** (*str*) – Credential file as specified to the initialization of the API.

Returns The default credential provider that CBCloudAPI should use.

Return type *CredentialProvider*

4.2.3 cbc_sdk.credential_providers.environ_credential_provider module

Credentials provider that reads the credentials from the environment.

class EnvironCredentialProvider
Bases: *cbc_sdk.credentials.CredentialProvider*

The object which provides credentials based on variables in the environment.

Initializes the EnvironCredentialProvider.

get_credentials(*section=None*)
Return a Credentials object containing the configured credentials.

Parameters **section** (*str*) – The credential section to retrieve (not used in this provider).

Returns The credentials retrieved from that source.

Return type *Credentials*

Raises CredentialError – If there is any error retrieving the credentials.

4.2.4 cbc_sdk.credential_providers.file_credential_provider module

Credentials provider that reads the credentials from a file.

class FileCredentialProvider(*credential_file=None*)
Bases: *cbc_sdk.credentials.CredentialProvider*

The object which provides credentials based on a credential file.

Initialize the FileCredentialProvider.

Parameters **credential_file** (*object*) – A string or path-like object representing the credentials file, or a list of strings or path-like objects representing the search path for the credentials file.

get_credentials(*section=None*)
Return a Credentials object containing the configured credentials.

Parameters **section** (*str*) – The credential section to retrieve.

Returns The credentials retrieved from that source.

Return type *Credentials*

Raises CredentialError – If there is any error retrieving the credentials.

4.2.5 cbc_sdk.credential_providers.registry_credential_provider module

Credentials provider that reads the credentials from the environment.

OpenKey(*base*, *path*)
Stub to maintain source compatibility

QueryValueEx(*key*, *name*)
Stub to maintain source compatibility

class RegistryCredentialProvider(*keypath=None*, *userkey=True*)
Bases: *cbc_sdk.credentials.CredentialProvider*

The credentials provider that reads from the Windows Registry.

Initialize the RegistryCredentialProvider.

Parameters

- **keypath** (*str*) – Path from the selected base key to the key that will contain individual sections.
- **userkey** (*bool*) – True if the keypath starts at HKEY_CURRENT_USER, False if at HKEY_LOCAL_MACHINE.

Raises CredentialError – If we attempt to instantiate this provider on a non-Windows system.

get_credentials(*section=None*)
Return a Credentials object containing the configured credentials.

Parameters **section** (*str*) – The credential section to retrieve.

Returns The credentials retrieved from that source.

Return type *Credentials*

Raises CredentialError – If there is any error retrieving the credentials.

4.2.6 Module contents

4.3 Developing New Credential Providers

The credentials management framework for the CBC SDK is designed to allow different handlers to be implemented, which may supply credentials to the CBCloudAPI in ways not implemented by existing credential handlers.

4.3.1 Writing the Credential Provider

Find all classes required to implement a new credential provider in the cbc_sdk.credentials package. See below for descriptions of the classes. It is recommended, but not required, that your new credential provider inherit from the CredentialProvider abstract class, and that you implement the methods from that abstract class as detailed.

The arguments to the standard __init__() method are not defined by the interface specification; those may be used to initialize your credential provider in any desired fashion.

4.3.2 Using the Credential Provider

Create an instance of your credential provider object and pass it as the keyword parameter `credential_provider` when creating your `CBCloudAPI` object. Example:

```
>>> provider = MyCredentialProvider()
>>> cbc_api = CBCloudAPI(credential_provider=provider, profile='default')
```

Your credential provider's `get_credentials()` method will be called, passing in any profile specified in the `profile` keyword parameter used when creating `CBCloudAPI`.

4.3.3 Credential Provider Reference

These are the classes from the `cbc_sdk.credentials` package that are used in making a credential provider.

CredentialValue class

This class is of an enumerated type, and represents the various credential items loaded by the credential provider and fed to the rest of the SDK code. The possible values are:

- `URL` - The URL used to access the Carbon Black Cloud. This value *must* be specified.
- `TOKEN` - The access token to be used to authenticate to the server. It is the same structure as the `X-Auth-Token:` defined for direct API access in the developer documentation. This value *must* be specified.
- `ORG_KEY` - The organization key specifying which organization to work with. This value *must* be specified.
- `SSL_VERIFY` - A Boolean value indicating whether or not to validate the SSL connection. The default is `True`.
- `SSL_VERIFY_HOSTNAME` - A Boolean value indicating whether or not to verify the host name of the server being connected to. The default is `True`.
- `SSL_CERT_FILE` - The name of an optional certificate file used to validate the certificates of the SSL connection. If not specified, the standard system certificate verification will be used.
- `SSL_FORCE_TLS_1_2` - A Boolean value. If this is `True`, the connection will be forced to use TLS 1.2 rather than any later version. The default is `False`.
- `PROXY` - If specified, this is the name of a proxy host to be used in making the connection.
- `IGNORE_SYSTEM_PROXY` - A Boolean value. If this is `True`, any system proxy settings will be ignored in making the connection to the server. The default is `False`.
- `INTEGRATION` - The name of the integration to use these credentials. The string may optionally end with a slash character, followed by the integration's version number. Passed as part of the `User-Agent:` HTTP header on all requests made by the SDK.

Values of this type have one method:

requires_boolean_value

```
def requires_boolean_value(self):
```

Returns whether or not this particular credential item takes a Boolean value.

Returns: `True` if the credential item takes a Boolean value, `False` if the credential item takes a string value.

Credentials class

The class that holds credentials retrieved from the credential provider, and is used by the rest of the SDK. It is effectively immutable after creation.

__init__

```
def __init__(self, values=None):
```

Initializes a new `Credentials` object.

Parameters:

- `values` (type `dict`): A dictionary containing the values to initialize the `Credentials` object with. The keys of this dictionary may be either `CredentialValue` objects or their lowercase string equivalents, e.g. `CredentialValue.URL` or `"url"`. The values in the dict are strings for those credential items with string values. For credential items with Boolean values, the values may be either `bool` values, numeric values (with 0 being treated as `False` and non-zero values treated as `True`), or string values. In the case of string values, the value must be "0", "false", "off", or "no" to be treated as a `False` falue, or "1", "true", "on", or "yes" to be treated as a `True` value (all values case-insensitive). If an unrecognized string is used for a Boolean value, `CredentialError` will be raised. Unrecognized keys in the dict are ignored. Any missing items will be replaced by the default for that item.

Raises:

- `CredentialError` - If there is an error parsing a Boolean value string.

get_value

```
def get_value(self, key):
```

Retrieves a specific credential value from this object.

Parameters:

- `key` (type `CredentialValue`): Indicates which item to retrieve.

Returns: The value of that credential item (`str` or `bool` type).

__getattr__

```
def __getattr__(self, name):
```

Retrieves a specific credential value from this object. This is a bit of "syntactic sugar" allowing other code to access credential values, for instance, as `cred_object.url` instead of `cred_object.get_value(CredentialValue.URL)`.

Parameters:

- `name` (type `str`): Indicates which item to retrieve.

Returns: The value of that credential item (`str` or `bool` type).

Raises:

- `AttributeError` - If the credential item `name` was unrecognized.

CredentialProvider class

All credential providers *should* extend this abstract class, but, in any event, *must* implement the protocol it defines.

get_credentials

```
def get_credentials(self, section=None):
```

Return a Credentials object containing the configured credentials.

Parameters:

- `section` (type `str`): Indicates the credential section to retrieve. May be interpreted by the credential provider in amy manner it likes; may also be ignored.

Returns: A `Credentials` object containing the retrieved credentials.

Raises:

- `CredentialError` - If there is an error retrieving the credentials.

4.4 Endpoint Standard

4.4.1 Submodules

4.4.2 cbc_sdk.endpoint_standard.base module

Model and Query Classes for Endpoint Standard

class EndpointStandardMutableModel(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=False*)

Bases: *cbc_sdk.base.MutableBaseModel*

Represents a EndpointStandardMutableModel object in the Carbon Black server.

Initialize an EndpointStandardMutableModel with model_unique_id and initial_data.

class EnrichedEvent(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=True*)

Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a EnrichedEvent object in the Carbon Black server.

Initialize the EnrichedEvent object.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **model_unique_id** (*Any*) – The unique ID for this particular instance of the model object.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

approve_process_sha256(*description=''*)

Approves the application by adding the process_sha256 to the WHITE_LIST

Parameters **description** – The justification for why the application was added to the WHITE_LIST

Returns

ReputationOverride object created in the Carbon Black Cloud

Return type *ReputationOverride* (cbc_sdk.platform.ReputationOverride)

ban_process_sha256(*description=''*)

Bans the application by adding the process_sha256 to the BLACK_LIST

Parameters **description** – The justification for why the application was added to the BLACK_LIST

Returns

ReputationOverride object created in the Carbon Black Cloud

Return type *ReputationOverride* (cbc_sdk.platform.ReputationOverride)

default_sort = 'device_timestamp'

get_details(*timeout=0*, *async_mode=False*)
Requests detailed results.

Parameters

- **timeout** (*int*) – Event details request timeout in milliseconds.
- **async_mode** (*bool*) – True to request details in an asynchronous manner.

Note:

- When using asynchronous mode, this method returns a python future. You can call result() on the future object to wait for completion and get the results.

---

primary_key = 'event_id'

process_sha256
Returns a string representation of the SHA256 hash for this process.

Returns SHA256 hash of the process.

Return type hash (str)

class EnrichedEventFacet(*cb*, *model_unique_id*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a EnrichedEventFacet object in the Carbon Black server.

Variables

- ***job_id*** – The Job ID assigned to this query
- ***terms*** – Contains the Enriched Event Facet search results
- ***ranges*** – Groupings for search result properties that are ISO 8601 timestamps or numbers
- ***contacted*** – The number of searchers contacted for this query
- ***completed*** – The number of searchers that have reported their results

Initialize the Terms object with initial data.

class Ranges(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Ranges object in the Carbon Black server.

Initialize an EnrichedEventFacet Ranges object with initial_data.

facets
Returns the reified *EnrichedEventFacet.Terms._facets* for this result.

fields
Returns the ranges fields for this result.

class Terms(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Terms object in the Carbon Black server.

Initialize an EnrichedEventFacet Terms object with initial_data.

facets
Returns the terms' facets for this result.

fields
Returns the terms facets' fields for this result.

completed = None

contacted = None

job_id = None

num_found = None

primary_key = 'job_id'

ranges = []

ranges_
Returns the reified *EnrichedEventFacet.Ranges* for this result.

result_url = '/api/investigate/v2/orgs/{}/enriched_events/facet_jobs/{}/results'

submit_url = '/api/investigate/v2/orgs/{}/enriched_events/facet_jobs'

terms = {}

terms_
Returns the reified *EnrichedEventFacet.Terms* for this result.

class EnrichedEventQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.Query*

Represents the query logic for an Enriched Event query.

This class specializes *Query* to handle the particulars of enriched events querying.

Initialize the EnrichedEventQuery object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

aggregation(*field*)
Performs an aggregation search where results are grouped by an aggregation field

Parameters **field** (*str*) – The aggregation field, either 'process_sha256' or 'device_id'

or_(***kwargs*)
or_ criteria are explicitly provided to EnrichedEvent queries although they are endpoint_standard.

This method overrides the base class in order to provide or_() functionality rather than raising an exception.

set_rows(*rows*)
Sets the 'rows' query body parameter to the 'start search' API call, determining how many rows to request.

Parameters **rows** (*int*) – How many rows to request.

timeout(*msecs*)
Sets the timeout on a event query.

Parameters **msecs** (*int*) – Timeout duration, in milliseconds.

Returns

The Query object with new milliseconds parameter.

Return type *Query* (*EnrichedEventQuery*)

Example: >>> cb.select(EnrichedEvent).where(process_name="foo.exe").timeout(5000)

class Event(*cb*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.base.NewBaseModel*

Represents a Event object in the Carbon Black server.

Initialize an Event with model_unique_id and initial_data.

info_key = 'eventInfo'

primary_key = 'eventId'

urlobject = '/integrationServices/v3/event'

class Policy(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=False*)
Bases: *cbc_sdk.endpoint_standard.base.EndpointStandardMutableModel*, *cbc_sdk.base.CreatableModelMixin*

Represents a Policy object in the Carbon Black server.

Initialize an EndpointStandardMutableModel with model_unique_id and initial_data.

add_rule(*new_rule*)
Adds a rule to this Policy.

Parameters **new_rule** (*dict(str,str)*) – The new rule to add to this Policy.

Notes

- The new rule must conform to this dictionary format:

  {"action": "ACTION", "application": {"type": "TYPE", "value": "VALUE"}, "operation": "OPERATION", "required": "REQUIRED"}

- The dictionary keys have these possible values:

  "action": ["IGNORE", "ALLOW", "DENY", "TERMINATE_PROCESS",
  "TERMINATE_THREAD", "TERMINATE"]

  "type": ["NAME_PATH", "SIGNED_BY", "REPUTATION"] "value": Any string value to match on "operation": ["BYPASS_ALL", "INVOKE_SCRIPT", "INVOKE_SYSAPP",

  "POL_INVOKE_NOT_TRUSTED", "INVOKE_CMD_INTERPRETER", "RANSOM", "NETWORK", "PROCESS_ISOLATION", "CODE_INJECTION", "MEMORY_SCRAPE", "RUN_INMEMORY_CODE", "ESCALATE", "RUN"]

  "required": [True, False]

delete_rule(*rule_id*)
Deletes a rule from this Policy.

description = None

id = None

info_key = 'policyInfo'

latestRevision = None

name = None

policy = {}

priorityLevel = None

replace_rule(*rule_id*, *new_rule*)
Replaces a rule in this policy.

rules
Returns a dictionary of rules and rule IDs for this Policy.

systemPolicy = None

urlobject = '/integrationServices/v3/policy'

version = None

class Query(*doc_class*, *cb*, *query=None*)
Bases: *cbc_sdk.base.PaginatedQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*

Represents a prepared query to the Cb Endpoint Standard server.

This object is returned as part of a *CBCloudAPI.select* operation on models requested from the Cb Endpoint Standard server. You should not have to create this class yourself.

The query is not executed on the server until it's accessed, either as an iterator (where it will generate values on demand as they're requested) or as a list (where it will retrieve the entire result set and save to a list). You can also call the Python built-in 'len() on this object to retrieve the total number of items matching the query.

Example: >>> from cbc_sdk import CBCloudAPI >>> cb = CBCloudAPI()

Notes

- The slicing operator only supports start and end parameters, but not step. `[1:-1]` is legal, but `[1:2:-1]` is not.
- You can chain where clauses together to create AND queries; only objects that match all `where` clauses will be returned. - Device Queries with multiple search parameters only support AND operations, not OR. Use of Query.or_(myParameter='myValue') will add 'AND myParameter:myValue' to the search query.

Initialize a Query object.

or_(***kwargs*)
Unsupported. Will raise if called.

Raises `ApiError` – .or_() cannot be called on Endpoint Standard queries.

prepare_query(*args*)
Adds query parameters that are part of a *select().where()* clause to the request.

log = <Logger cbc_sdk.endpoint_standard.base (WARNING)>
Endpoint Standard Models

4.4.3 cbc_sdk.endpoint_standard.usb_device_control module

Model and Query Classes for USB Device Control

class USBDevice(*cb*, *model_unique_id*, *initial_data=None*)

Bases: *cbc_sdk.base.NewBaseModel*

Represents a USBDevice object in the Carbon Black server.

Variables

- ***created_at*** – the UTC date the external USB device configuration was created in ISO 8601 format
- ***device_friendly_name*** – human readable name for the external USB device
- ***device_name*** – name of the external USB device
- ***device_type*** – type of external USB device
- ***endpoint_count*** – number of endpoints that the external USB device has connected to
- ***first_seen*** – first timestamp that the external USB device was seen
- ***id*** – the id for this external USB device
- ***interface_type*** – type of interface used by external USB device
- ***last_endpoint_id*** – ID of the last endpoint the device accessed
- ***last_endpoint_name*** – name of the last endpoint the device accessed
- ***last_policy_id*** – ID of the last policy associated with the device
- ***last_seen*** – last timestamp that the external USB device was seen
- ***org_key*** – unique org key of the organization that the external USB device was connected to
- ***product_id*** – product ID of the external USB device in decimal form
- ***product_name*** – product name of the external USB device
- ***serial_number*** – serial number of external device
- ***status*** – Calculated status of device
- ***updated_at*** – the UTC date the external USB device configuration was updated in ISO 8601 format
- ***vendor_id*** – ID of the Vendor for the external USB device in decimal form
- ***vendor_name*** – vendor name of the external USB device

Initialize the USBDevice object.

Parameters

- **cb** (*BaseAPI*) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.
- **initial_data** (*dict*) – Initial data used to populate the alert.

approve(*approval_name*, *notes*)

Creates and saves an approval for this USB device, allowing it to be treated as approved from now on.

Parameters

- **approval_name** (*str*) – The name for this new approval.
- **notes** (*str*) – Notes to be added to this approval.

Returns The new approval.

Return type *USBDeviceApproval*

created_at = None

device_friendly_name = None

device_name = None

device_type = None

endpoint_count = None

first_seen = None

get_endpoints()
Returns the information about endpoints associated with this USB device.

Returns List of information about USB endpoints, each item specified as a dict.

Return type list

classmethod get_vendors_and_products_seen(*cb*)
Returns all vendors and products that have been seen for the organization.

Parameters **cb** (BaseAPI) – Reference to API object used to communicate with the server.

Returns A list of vendors and products seen for the organization, each vendor being represented by a dict.

Return type list

id = None

interface_type = None

last_endpoint_id = None

last_endpoint_name = None

last_policy_id = None

last_seen = None

org_key = None

primary_key = 'id'

product_id = None

product_name = None

serial_number = None

status = None

updated_at = None

urlobject = '/device_control/v3/orgs/{0}/devices'

urlobject_single = '/device_control/v3/orgs/{0}/devices/{1}'

vendor_id = None

vendor_name = None

class USBDeviceApproval(*cb*, *model_unique_id*, *initial_data=None*)

Bases: *cbc_sdk.base.MutableBaseModel*

Represents a USBDeviceApproval object in the Carbon Black server.

Variables

- ***approval_name*** – the name of the approval
- ***created_at*** – the UTC date the approval was created in ISO 8601 format
- ***id*** – the id for this approval
- ***notes*** – the notes for the approval
- ***product_id*** – product ID of the approval's external USB device in hex form
- ***product_name*** – product name of the approval's external USB device
- ***serial_number*** – serial number of the approval's external device
- ***updated_at*** – the UTC date the approval was updated in ISO 8601 format
- ***updated_by*** – the user who updated the record last
- ***vendor_id*** – ID of the Vendor for the approval's external USB device in hex form
- ***vendor_name*** – vendor name of the approval's external USB device

Initialize the USBDeviceApproval object.

Parameters

- **cb** (*BaseAPI*) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.
- **initial_data** (*dict*) – Initial data used to populate the alert.

approval_name = None

classmethod bulk_create(*cb*, *approvals*)

Creates multiple approvals and returns the USBDeviceApproval objects. Data is supplied as a list of dicts.

Parameters

- **cb** (*BaseAPI*) – Reference to API object used to communicate with the server.
- **approvals** (*list*) – List of dicts containing approval data to be created, formatted as shown below.

Example

[

{ "approval_name": "string", "notes": "string", "product_id": "string", "serial_number": "string", "vendor_id": "string"

}

]

Returns A list of USBDeviceApproval objects representing the approvals that were created.

Return type list

classmethod bulk_create_csv(*cb*, *approval_data*)
Creates multiple approvals and returns the USBDeviceApproval objects. Data is supplied as text in CSV format.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **approval_data** (*str*) – CSV data for the approvals to be created. Header line MUST be included as shown below.

Example

vendor_id,product_id,serial_number,approval_name,notes string,string,string,string,string

Returns A list of USBDeviceApproval objects representing the approvals that were created.

Return type list

classmethod create_from_usb_device(*usb_device*)
Creates a new, unsaved approval object from a USBDeviceObject, filling in its basic fields.

Parameters **usb_device** (USBDevice) – The USB device to create the approval from.

Returns The new approval object.

Return type *USBDeviceApproval*

created_at = None

id = None

notes = None

primary_key = 'id'

product_id = None

product_name = None

serial_number = None

updated_at = None

updated_by = None

urlobject = '/device_control/v3/orgs/{0}/approvals'

urlobject_single = '/device_control/v3/orgs/{0}/approvals/{1}'

vendor_id = None

vendor_name = None

class USBDeviceApprovalQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*

Represents a query that is used to locate USBDeviceApproval objects.

Initialize the USBDeviceApprovalQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

set_device_ids(*device_ids*)
Restricts the device approvals that this query is performed on to the specified device IDs.

Parameters **device_ids** (*list*) – List of string device IDs.

Returns This instance.

Return type *USBDeviceApprovalQuery*

set_product_names(*product_names*)
Restricts the device approvals that this query is performed on to the specified product names.

Parameters **product_names** (*list*) – List of string product names.

Returns This instance.

Return type *USBDeviceApprovalQuery*

set_vendor_names(*vendor_names*)
Restricts the device approvals that this query is performed on to the specified vendor names.

Parameters **vendor_names** (*list*) – List of string vendor names.

Returns This instance.

Return type *USBDeviceApprovalQuery*

class USBDeviceBlock(*cb*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.base.NewBaseModel*

Represents a USBDeviceBlock object in the Carbon Black server.

Variables

- ***created_at*** – the UTC date the block was created in ISO 8601 format
- ***id*** – the id for this block
- ***policy_id*** – policy id which is blocked
- ***updated_at*** – the UTC date the block was updated in ISO 8601 format

Initialize the USBDeviceBlock object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.
- **initial_data** (*dict*) – Initial data used to populate the alert.

classmethod bulk_create(*cb*, *policy_ids*)
Creates multiple blocks and returns the USBDeviceBlocks that were created.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **policy_ids** (*list*) – List of policy IDs to have blocks created for.

Returns A list of USBDeviceBlock objects representing the approvals that were created.

Return type list

classmethod create(*cb*, *policy_id*)
Creates a USBDeviceBlock for a given policy ID.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **policy_id** (*str/int*) – Policy ID to create a USBDeviceBlock for.

Returns New USBDeviceBlock object representing the block.

Return type *USBDeviceBlock*

created_at = None

delete()
Delete this object.

id = None

policy_id = None

primary_key = 'id'

updated_at = None

urlobject = '/device_control/v3/orgs/{0}/blocks'

urlobject_single = '/device_control/v3/orgs/{0}/blocks/{1}'

class USBDeviceBlockQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*

Represents a query that is used to locate USBDeviceBlock objects.

Initialize the USBDeviceBlockQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

class USBDeviceQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*

Represents a query that is used to locate USBDevice objects.

Initialize the USBDeviceQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

VALID_FACET_FIELDS = ['vendor_name', 'product_name', 'endpoint.endpoint_name', 'status

VALID_STATUSES = ['APPROVED', 'UNAPPROVED']

facets(*fieldlist*, *max_rows=0*)
Return information about the facets for all known USB devices, using the defined criteria.

Parameters

- **fieldlist** (*list*) – List of facet field names. Valid names are “vendor_name”, “product_name”, “endpoint.endpoint_name”, and “status”.
- **max_rows** (*int*) – The maximum number of rows to return. 0 means return all rows.

Returns A list of facet information specified as dicts.

Return type list

set_endpoint_names(*endpoint_names*)
Restricts the devices that this query is performed on to the specified endpoint names.

Parameters **endpoint_names** (*list*) – List of string endpoint names.

Returns This instance.

Return type *USBDeviceQuery*

set_product_names(*product_names*)
Restricts the devices that this query is performed on to the specified product names.

Parameters **product_names** (*list*) – List of string product names.

Returns This instance.

Return type *USBDeviceQuery*

set_serial_numbers(*serial_numbers*)
Restricts the devices that this query is performed on to the specified serial numbers.

Parameters **serial_numbers** (*list*) – List of string serial numbers.

Returns This instance.

Return type *USBDeviceQuery*

set_statuses(*statuses*)
Restricts the devices that this query is performed on to the specified status values.

Parameters **statuses** (*list*) – List of string status values. Valid values are APPROVED and UNAPPROVED.

Returns This instance.

Return type *USBDeviceQuery*

set_vendor_names(*vendor_names*)
Restricts the devices that this query is performed on to the specified vendor names.

Parameters **vendor_names** (*list*) – List of string vendor names.

Returns This instance.

Return type *USBDeviceQuery*

sort_by(*key*, *direction='ASC'*)
Sets the sorting behavior on a query's results.

Example

```
>>> cb.select(USBDevice).sort_by("product_name")
```

Parameters

- **key** (*str*) – The key in the schema to sort by.
- **direction** (*str*) – The sort order, either "ASC" or "DESC".

Returns This instance.

Return type *USBDeviceQuery*

log = <Logger cbc_sdk.endpoint_standard.usb_device_control (WARNING)>
USB Device Control models

4.4.4 Module contents

4.5 Enterprise EDR

4.5.1 Submodules

4.5.2 cbc_sdk.enterprise_edr.threat_intelligence module

Model Classes for Enterprise Endpoint Detection and Response

class Feed(*cb*, *model_unique_id=None*, *initial_data=None*)
Bases: *cbc_sdk.enterprise_edr.threat_intelligence.FeedModel*

Represents a Feed object in the Carbon Black server.

Variables

- ***name*** – A human-friendly name for this feed
- ***owner*** – The feed owner's connector ID
- ***provider_url*** – A URL supplied by the feed's provider
- ***summary*** – A human-friendly summary for the feed
- ***category*** – The feed's category
- ***source_label*** – The feed's source label
- ***access*** – The feed's access (public or private)
- ***id*** – The feed's unique ID

Initialize the Feed object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **model_unique_id** (*str*) – The unique ID of the feed.
- **initial_data** (*dict*) – The initial data for the object.

class FeedBuilder(*cb*, *info*)
Bases: object

Helper class allowing Feeds to be assembled.

Creates a new FeedBuilder object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **info** (*dict*) – The initial information for the new feed.

add_reports(*reports*)
Adds new reports to the new feed.

Parameters **reports** (*list[Report]*) – New reports to be added to the feed.
Returns This object.
Return type *FeedBuilder*

build()
Builds the new Feed.
Returns The new Feed.
Return type *Feed*

set_category(*category*)
Sets the category for the new feed.
Parameters **category** (*str*) – New category for the feed.
Returns This object.
Return type *FeedBuilder*

set_name(*name*)
Sets the name for the new feed.
Parameters **name** (*str*) – New name for the feed.
Returns This object.
Return type *FeedBuilder*

set_provider_url(*provider_url*)
Sets the provider URL for the new feed.
Parameters **provider_url** (*str*) – New provider URL for the feed.
Returns This object.
Return type *FeedBuilder*

set_source_label(*source_label*)
Sets the source label for the new feed.
Parameters **source_label** (*str*) – New source label for the feed.
Returns This object.
Return type *FeedBuilder*

set_summary(*summary*)
Sets the summary for the new feed.
Parameters **summary** (*str*) – New summary for the feed.
Returns This object.
Return type *FeedBuilder*

access = None

append_reports(*reports*)
Append the given Reports to this Feed's current Reports.

Parameters **reports** (*[Report]*) – List of Reports to append to Feed.

Raises InvalidObjectError – If *id* is missing.

append_reports_rawdata(*report_data*)
Append the given report data, formatted as per the API documentation for reports, to this Feed's Reports.

Parameters **report_data** (*list[dict]*) –

Raises InvalidObjectError – If *id* is missing or validation of the data fails.

category = None

classmethod create(*cb*, *name*, *provider_url*, *summary*, *category*)
Begins creating a new feed by making a FeedBuilder to hold the new feed data.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **name** (*str*) – Name for the new feed.
- **provider_url** (*str*) – Provider URL for the new feed.
- **summary** (*str*) – Summary for the new feed.
- **category** (*str*) – Category for the new feed.

Returns The new FeedBuilder object to be used to create the feed.

Return type *FeedBuilder*

delete()
Deletes this feed from the Enterprise EDR server.

Raises InvalidObjectError – If *id* is missing.

id = None

name = None

owner = None

primary_key = 'id'

provider_url = None

replace_reports(*reports*)
Replace this Feed's Reports with the given Reports.

Parameters **reports** (*[Report]*) – List of Reports to replace existing Reports with.

Raises InvalidObjectError – If *id* is missing.

replace_reports_rawdata(*report_data*)
Replace this Feed's Reports with the given reports, specified as raw data.

Parameters **report_data** (*list[dict]*) –

Raises InvalidObjectError – If *id* is missing or validation of the data fails.

reports
Returns a list of Reports associated with this feed.

Returns List of Reports in this Feed.

Return type Reports ([*Report*])

save(*public=False*)
Saves this feed on the Enterprise EDR server.

Parameters **public** (*bool*) – Whether to make the feed publicly available.

Returns The saved Feed.

Return type *Feed* (*Feed*)

source_label = None

summary = None

update(***kwargs*)
Update this feed's metadata with the given arguments.

Parameters ****kwargs** (*dict(str, str)*) – The fields to update.

Raises

- `InvalidObjectError` – If *id* is missing or Feed.validate() fails.
- `ApiError` – If an invalid field is specified.

Example:

```
>>> feed.update(access="private")
```

urlobject = '/threathunter/feedmgr/v2/orgs/{}/feeds'

urlobject_single = '/threathunter/feedmgr/v2/orgs/{}/feeds/{}'

validate()
Checks to ensure this feed contains valid data.

Raises `InvalidObjectError` – If the feed contains invalid data.

class FeedModel(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=False*)
Bases: *cbc_sdk.base.UnrefreshableModel*, *cbc_sdk.base.CreatableModelMixin*, *cbc_sdk.base.MutableBaseModel*

Represents a FeedModel object in the Carbon Black server.

Initialize the NewBaseModel object.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **model_unique_id** (*Any*) – The unique ID for this particular instance of the model object.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

SCHEMA_IOCV2 = Schema({'id': And(And(<class 'str'>), <built-in function len>), 'match

SCHEMA_REPORT = Schema({'id': And(And(<class 'str'>), <built-in function len>), 'time

class FeedQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.SimpleQuery*

Represents the logic for a Feed query.

```
>>> cb.select(Feed)
>>> cb.select(Feed, id)
>>> cb.select(Feed).where(include_public=True)
```

Initialize the FeedQuery object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.

results
Return a list of Feed objects matching self._args parameters.

where(***kwargs*)
Add kwargs to self._args dictionary.

class IOC(*cb*, *model_unique_id=None*, *initial_data=None*, *report_id=None*)
Bases: *cbc_sdk.enterprise_edr.threat_intelligence.FeedModel*

Represents a IOC object in the Carbon Black server.

Variables

- ***md5*** – A list of MD5 checksums
- ***ipv4*** – A list of IPv4 addresses
- ***ipv6*** – A list of IPv6 addresses
- ***dns*** – A list of domain names
- ***query*** – A list of dicts, each containing an IOC query

Creates a new IOC instance.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – Unique ID of this IOC.
- **initial_data** (*dict*) – Initial data used to populate the IOC.
- **report_id** (*str*) – ID of the report this IOC belongs to (if this is a watchlist IOC).

Raises ApiError – If *initial_data* is None.

dns = []

ipv4 = []

ipv6 = []

md5 = []

query = []

validate()
Checks to ensure this IOC contains valid data.

Raises InvalidObjectError – If the IOC contains invalid data.

class IOC_V2(*cb*, *model_unique_id=None*, *initial_data=None*, *report_id=None*)
Bases: *cbc_sdk.enterprise_edr.threat_intelligence.FeedModel*

Represents a IOC_V2 object in the Carbon Black server.

Variables

- ***id*** – The IOC_V2's unique ID
- ***match_type*** – How IOCs in this IOC_V2 are matched
- ***values*** – A list of IOCs
- ***field*** – The kind of IOCs contained in this IOC_V2
- ***link*** – A URL for some reference for this IOC_V2

Creates a new IOC_V2 instance.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*Any*) – Unused.

- **initial_data** (*dict*) – Initial data used to populate the IOC.
- **report_id** (*str*) – ID of the report this IOC belongs to (if this is a watchlist IOC).

Raises ApiError – If *initial_data* is None.

classmethod create_equality(*cb*, *iocid*, *field*, **values*)
Creates a new "equality" IOC.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **iocid** (*str*) – ID for the new IOC. If this is None, a UUID will be generated for the IOC.
- **field** (*str*) – Name of the field to be matched by this IOC.
- ***values** (*list (str)*) – String values to match against the value of the specified field.

Returns New IOC data structure.

Return type *IOC_V2*

Raises ApiError – If there is not at least one value to match against.

classmethod create_query(*cb*, *iocid*, *query*)
Creates a new "query" IOC.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **iocid** (*str*) – ID for the new IOC. If this is None, a UUID will be generated for the IOC.
- **query** (*str*) – Query to be incorporated in this IOC.

Returns New IOC data structure.

Return type *IOC_V2*

Raises ApiError – If the query string is not present.

classmethod create_regex(*cb*, *iocid*, *field*, **values*)
Creates a new "regex" IOC.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **iocid** (*str*) – ID for the new IOC. If this is None, a UUID will be generated for the IOC.
- **field** (*str*) – Name of the field to be matched by this IOC.
- ***values** (*list (str)*) – Regular expression values to match against the value of the specified field.

Returns New IOC data structure.

Return type *IOC_V2*

Raises ApiError – If there is not at least one regular expression to match against.

field = None

id = None

ignore()
Sets the ignore status on this IOC.

Only watchlist IOCs have an ignore status.

Raises InvalidObjectError – If *id* is missing or this IOC is not from a Watchlist.

ignored
Returns whether or not this IOC is ignored.

Only watchlist IOCs have an ignore status.

Returns True if the IOC is ignored, False otherwise.

Return type bool

Raises InvalidObjectError – If this IOC is missing an *id* or is not a Watchlist IOC.

Example:

```
>>> if ioc.ignored:
...     ioc.unignore()
```

classmethod ipv6_equality_format(*input*)
Turns a canonically-formatted IPv6 address into a string suitable for use in an equality IOC.

Parameters **input** (*str*) – The IPv6 address to be translated.

Returns The translated form of IPv6 address.

Return type str

Raises ApiError – If the string is not in valid format.

link = None

match_type = None

primary_key = 'id'

unignore()
Removes the ignore status on this IOC.

Only watchlist IOCs have an ignore status.

Raises InvalidObjectError – If *id* is missing or this IOC is not from a Watchlist.

validate()
Checks to ensure this IOC contains valid data.

Raises InvalidObjectError – If the IOC contains invalid data.

values = []

class Report(*cb*, *model_unique_id=None*, *initial_data=None*, *feed_id=None*, *from_watchlist=False*)
Bases: *cbc_sdk.enterprise_edr.threat_intelligence.FeedModel*

Represents a Report object in the Carbon Black server.

Variables

- ***id*** – The report's unique ID
- ***timestamp*** – When this report was created
- ***title*** – A human-friendly title for this report
- ***description*** – A human-friendly description for this report

- ***severity*** – The severity of the IOCs within this report
- ***link*** – A URL for some reference for this report
- ***tags*** – A list of tags for this report
- ***iocs_v2*** – A list of IOC_V2 dicts associated with this report
- ***visibility*** – The visibility of this report

Initialize the ReportSeverity object.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **model_unique_id** (*Any*) – Unused.
- **initial_data** (*dict*) – The initial data for the object.
- **feed_id** (*str*) – The ID of the feed this report is for.
- **from_watchlist** (*str*) – The ID of the watchlist this report is for.

class ReportBuilder(*cb*, *report_body*)

Bases: object

Helper class allowing Reports to be assembled.

Initialize a new ReportBuilder.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **report_body** (*dict*) – Partial report body which should be filled in with all "required" fields.

add_ioc(*ioc*)

Adds an IOC to the new report.

Parameters **ioc** (*IOC_V2*) – The IOC to be added to the report.
Returns This object.
Return type *ReportBuilder*

add_tag(*tag*)

Adds a tag value to the new report.

Parameters **tag** (*str*) – The new tag for the object.
Returns This object.
Return type *ReportBuilder*

build()

Builds the actual Report from the internal data of the ReportBuilder.

Returns The new Report.
Return type *Report*

set_description(*description*)

Set the description for the new report.

Parameters **description** (*str*) – New description for the report.
Returns This object.
Return type *ReportBuilder*

set_link(*link*)

Set the link for the new report.

Parameters **link** (*str*) – New link for the report.
Returns This object.

Return type *ReportBuilder*

set_severity(*severity*)
Set the severity for the new report.
Parameters **severity** (*int*) – New severity for the report.
Returns This object.
Return type *ReportBuilder*

set_timestamp(*timestamp*)
Set the timestamp for the new report.
Parameters **timestamp** (*int*) – New timestamp for the report.
Returns This object.
Return type *ReportBuilder*

set_title(*title*)
Set the title for the new report.
Parameters **title** (*str*) – New title for the report.
Returns This object.
Return type *ReportBuilder*

set_visibility(*visibility*)
Set the visibility for the new report.
Parameters **visibility** (*str*) – New visibility for the report.
Returns This object.
Return type *ReportBuilder*

append_iocs(*iocs*)
Append a list of IOCs to this Report.

Parameters **iocs** (*list[IOC_V2]*) – List of IOCs to be added.

classmethod create(*cb*, *title*, *description*, *severity*, *timestamp=None*, *tags=None*)
Begin creating a new Report by returning a ReportBuilder.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **title** (*str*) – Title for the new report.
- **description** (*str*) – Description for the new report.
- **severity** (*int*) – Severity value for the new report.
- **timestamp** (*int*) – UNIX-epoch timestamp for the new report. If omitted, current time will be used.
- **tags** (*list[str]*) – Tags to be added to the report. If omitted, there will be none.

Returns Reference to the ReportBuilder object.

Return type *ReportBuilder*

custom_severity
Returns the custom severity for this report.

Returns

The custom severity for this Report, if it exists.

Return type *ReportSeverity* (*ReportSeverity*)

Raises InvalidObjectError – If *id* ismissing or this Report is from a Watchlist.

delete()
Deletes this report from the Enterprise EDR server.

Raises InvalidObjectError – If *id* is missing, or *feed_id* is missing and this report is a Feed Report.

Example:

```
>>> report.delete()
```

description = None

id = None

ignore()
Sets the ignore status on this report.

Only watchlist reports have an ignore status.

Raises InvalidObjectError – If *id* is missing or this Report is not from a Watchlist.

ignored
Returns the ignore status for this report.

Only watchlist reports have an ignore status.

Returns True if this Report is ignored, False otherwise.

Return type (bool)

Raises InvalidObjectError – If *id* is missing or this Report is not from a Watchlist.

Example:

```
>>> if report.ignored:
...     report.unignore()
```

iocs = {}

iocs_
Returns a list of IOC_V2's associated with this report.

Returns List of IOC_V2's for associated with the Report.

Return type *IOC_V2* ([*IOC_V2*])

Example:

```
>>> for ioc in report.iocs_:
...     print(ioc.values)
```

iocs_v2 = []

link = None

primary_key = 'id'

remove_iocs(*iocs*)
Remove a list of IOCs from this Report.

Parameters **iocs** (*list[IOC_V2]*) – List of IOCs to be removed.

remove_iocs_by_id(*ids_list*)
Remove IOCs from this report by specifying their IDs.

Parameters **ids_list** (*list[str]*) – List of IDs of the IOCs to be removed.

save_watchlist()
Saves this report *as a watchlist report*.

Note: This method **cannot** be used to save a feed report. To save feed reports, create them with *cb.create* and use *Feed.replace*.

Raises InvalidObjectError – If Report.validate() fails.

severity = None

tags = []

timestamp = None

title = None

unignore()
Removes the ignore status on this report.

Only watchlist reports have an ignore status.

Raises InvalidObjectError – If *id* is missing or this Report is not from a Watchlist.

update(***kwargs*)
Update this Report with the given arguments.

Parameters ****kwargs** (*dict(str, str)*) – The Report fields to update.

Returns The updated Report.

Return type *Report* (*Report*)

Raises InvalidObjectError – If *id* is missing, or *feed_id* is missing and this report is a Feed Report, or Report.validate() fails.

Note: The report's timestamp is always updated, regardless of whether passed explicitly.

```
>>> report.update(title="My new report title")
```

urlobject = '/threathunter/feedmgr/v2/orgs/{}/feeds/{}/reports'

validate()
Checks to ensure this report contains valid data.

Raises InvalidObjectError – If the report contains invalid data.

visibility = None

class ReportQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.SimpleQuery*

Represents the logic for a Report query.

Note:

Only feed reports can be queried. Watchlist reports should be interacted with via Watchlist.reports().

Example: >>> cb.select(Report).where(feed_id=id)

Initialize the ReportQuery object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

results
Return a list of Report objects matching self._args['feed_id'].

where (***kwargs*)
Add kwargs to self._args dictionary.

class ReportSeverity(*cb*, *initial_data=None*)
Bases: *cbc_sdk.enterprise_edr.threat_intelligence.FeedModel*

Represents a ReportSeverity object in the Carbon Black server.

Variables

- ***report_id*** – The unique ID for the corresponding report
- ***severity*** – The severity level

Initialize the ReportSeverity object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **initial_data** (*dict*) – The initial data for the object.

primary_key = 'report_id'

report_id = None

severity = None

class Watchlist(*cb*, *model_unique_id=None*, *initial_data=None*)
Bases: *cbc_sdk.enterprise_edr.threat_intelligence.FeedModel*

Represents a Watchlist object in the Carbon Black server.

Variables

- ***name*** – A human-friendly name for the watchlist
- ***description*** – A short description of the watchlist
- ***id*** – The watchlist's unique id
- ***tags_enabled*** – Whether tags are currently enabled
- ***alerts_enabled*** – Whether alerts are currently enabled
- ***create_timestamp*** – When this watchlist was created
- ***last_update_timestamp*** – Report IDs associated with this watchlist
- ***report_ids*** – Report IDs associated with this watchlist
- ***classifier*** – A key, value pair specifying an associated feed

Initialize the Watchlist object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

- **model_unique_id** (*str*) – The unique ID of the watch list.
- **initial_data** (*dict*) – The initial data for the object.

class WatchlistBuilder(*cb*, *name*)

Bases: object

Helper class allowing Watchlists to be assembled.

Creates a new WatchlistBuilder object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **name** (*str*) – Name for the new watchlist.

add_report_ids(*report_ids*)

Adds report IDs to the watchlist.

Parameters **report_ids** (*list[str]*) – List of report IDs to add to the watchlist.
Returns This object.
Return type *WatchlistBuilder*

add_reports(*reports*)

Adds reports to the watchlist.

Parameters **reports** (*list[Report]*) – List of reports to be added to the watchlist.
Returns This object.
Return type *WatchlistBuilder*

build()

Builds the new Watchlist using information in the builder. The new watchlist must still be saved.

Returns The new Watchlist.
Return type *Watchlist*

set_alerts_enabled(*flag*)

Sets whether alerts will be enabled on the new watchlist.

Parameters **flag** (*bool*) – True to enable alerts, False to disable them. Default is False.
Returns This object.
Return type *WatchlistBuilder*

set_description(*description*)

Sets the description for the new watchlist.

Parameters **description** (*str*) – New description for the watchlist.
Returns This object.
Return type *WatchlistBuilder*

set_name(*name*)

Sets the name for the new watchlist.

Parameters **name** (*str*) – New name for the watchlist.
Returns This object.
Return type *WatchlistBuilder*

set_tags_enabled(*flag*)

Sets whether tags will be enabled on the new watchlist.

Parameters **flag** (*bool*) – True to enable tags, False to disable them. Default is True.
Returns This object.
Return type *WatchlistBuilder*

add_report_ids(*report_ids*)

Adds new report IDs to the watchlist.

Parameters **report_ids** (*list[str]*) – List of report IDs to be added to the watchlist.

add_reports(*reports*)
Adds new reports to the watchlist.

Parameters **reports** (*list[Report]*) – List of reports to be added to the watchlist.

alerts_enabled = None

classifier = {}

classifier_
Returns the classifier key and value, if any, for this watchlist.

Returns Watchlist's classifier key and value. None: If there is no classifier key and value.

Return type tuple(str, str)

classmethod create(*cb*, *name*)
Starts creating a new Watchlist by returning a WatchlistBuilder that can be used to set attributes.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **name** (*str*) – Name for the new watchlist.

Returns The builder for the new watchlist. Call build() to create the actual Watchlist.

Return type *WatchlistBuilder*

classmethod create_from_feed(*feed*, *name=None*, *description=None*, *enable_alerts=False*, *enable_tags=True*)
Creates a new Watchlist that encapsulates a Feed.

Parameters

- **feed** (Feed) – The feed to be encapsulated by this Watchlist.
- **name** (*str*) – Name for the new watchlist. The default is to use the Feed name.
- **description** (*str*) – Description for the new watchlist. The default is to use the Feed summary.
- **enable_alerts** (*bool*) –
- **enable_tags** (*bool*) –

Returns A new Watchlist object, which must be saved to the server.

Return type *Watchlist*

create_timestamp = None

delete()
Deletes this watchlist from the Enterprise EDR server.

Raises InvalidObjectError – If *id* is missing.

description = None

disable_alerts()
Disable alerts for this watchlist.

Raises InvalidObjectError – If *id* is missing.

disable_tags()
Disable tagging for this watchlist.

Raises InvalidObjectError – if *id* is missing.

enable_alerts()
Enable alerts for this watchlist. Alerts are not retroactive.

Raises InvalidObjectError – If *id* is missing.

enable_tags()
Enable tagging for this watchlist.

Raises InvalidObjectError – If *id* is missing.

feed
Returns the Feed linked to this Watchlist, if there is one.

id = None

last_update_timestamp = None

name = None

report_ids = []

reports
Returns a list of Report objects associated with this watchlist.

Returns List of Reports associated with the watchlist.

Return type Reports ([*Report*])

Note: If this Watchlist is a classifier (i.e. feed-linked) Watchlist, *reports* will be empty. To get the reports associated with the linked Feed, use feed like:

```
>>> for report in watchlist.feed.reports:
...     print(report.title)
```

---

save()
Saves this watchlist on the Enterprise EDR server.

Returns The saved Watchlist.

Return type *Watchlist* (*Watchlist*)

Raises InvalidObjectError – If Watchlist.validate() fails.

tags_enabled = None

update(***kwargs*)
Updates this watchlist with the given arguments.

Parameters ****kwargs** (*dict(str, str)*) – The fields to update.

Raises

- InvalidObjectError – If *id* is missing or Watchlist.validate() fails.
- ApiError – If *report_ids* is given and is empty.

Example:

```
>>> watchlist.update(name="New Name")
```

urlobject = '/threathunter/watchlistmgr/v2/watchlist'

urlobject_single = '/threathunter/watchlistmgr/v2/watchlist/{}'

validate()
Checks to ensure this watchlist contains valid data.

Raises InvalidObjectError – If the watchlist contains invalid data.

class WatchlistQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.SimpleQuery*

Represents the logic for a Watchlist query.

```
>>> cb.select(Watchlist)
```

Initialize the WatchlistQuery object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

results
Return a list of all Watchlist objects.

log = <Logger cbc_sdk.enterprise_edr.threat_intelligence (WARNING)>
Models

4.5.3 cbc_sdk.enterprise_edr.ubs module

Model Classes for Enterprise Endpoint Detection and Response

class Binary(*cb*, *model_unique_id*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Binary object in the Carbon Black server.

Variables

- ***sha256*** – The SHA-256 hash of the file
- ***md5*** – The MD5 hash of the file
- ***file_available*** – If true, the file is available for download
- ***available_file_size*** – The size of the file available for download
- ***file_size*** – The size of the actual file (represented by the hash)
- ***os_type*** – The OS that this file is designed for
- ***architecture*** – The set of architectures that this file was compiled for
- ***lang_id*** – The Language ID value for the Windows VERSIONINFO resource
- ***charset_id*** – The Character set ID value for the Windows VERSIONINFO resource
- ***internal_name*** – The internal name from FileVersionInformation
- ***product_name*** – The product name from FileVersionInformation
- ***company_name*** – The company name from FileVersionInformation
- ***trademark*** – The trademark from FileVersionInformation
- ***file_description*** – The file description from FileVersionInformation
- ***file_version*** – The file version from FileVersionInformation

- ***comments*** – Comments from FileVersionInformation
- ***original_filename*** – The original filename from FileVersionInformation
- ***product_description*** – The product description from FileVersionInformation
- ***product_version*** – The product version from FileVersionInformation
- ***private_build*** – The private build from FileVersionInformation
- ***special_build*** – The special build from FileVersionInformation

Initialize the Binary object.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **model_unique_id** (*str*) – The SHA-256 of the binary being retrieved.

class Summary(*cb*, *model_unique_id*)

Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Summary object in the Carbon Black server.

Initialize the Summary object.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **model_unique_id** (*str*) – The SHA-256 of the binary being retrieved.

primary_key = 'sha256'

urlobject_single = '/ubs/v1/orgs/{}/sha256/{}/summary/device'

architecture = []

available_file_size = None

charset_id = None

comments = None

company_name = None

download_url(*expiration_seconds=3600*)

Returns a URL that can be used to download the file for this binary. Returns None if no download found.

Parameters **expiration_seconds** (*int*) – How long the download should be valid for.

Returns A pre-signed AWS download URL. None: If no download is found.

Return type URL (str)

Raises *InvalidObjectError* – If the URL retrieval should be retried.

file_available = None

file_description = None

file_size = None

file_version = None

internal_name = None

lang_id = None

md5 = None

original_filename = None

os_type = None

primary_key = 'sha256'

private_build = None

product_description = None

product_name = None

product_version = None

sha256 = None

special_build = None

summary
Returns organization-specific information about this binary.

trademark = None

urlobject_single = '/ubs/v1/orgs/{}/sha256/{}/metadata'

class Downloads(*cb*, *shas*, *expiration_seconds=3600*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Downloads object in the Carbon Black server.

Initialize the Downloads object.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **shas** (*list*) – A list of SHA hash values for binaries.
- **expiration_seconds** (*int*) – Number of seconds until this request expires.

class FoundItem(*cb*, *item*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a FoundItem object in the Carbon Black server.

Initialize the FoundItem object.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **item** (*dict*) – The values for a successfully-retrieved item.

primary_key = 'sha256'

found
Returns a list of Downloads.FoundItem, one for each binary found in the binary store.

Model and Query Classes for Platform Alerts and Workflows

class BaseAlert(*cb*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.platform.base.PlatformModel*

Represents a BaseAlert object in the Carbon Black server.

Variables

- ***category*** – Alert category - Monitored vs Threat
- ***create_time*** – Time the alert was created
- ***device_id*** – ID of the device
- ***device_name*** – Device name
- ***device_os*** – Device OS
- ***device_os_version*** – Device OS Version
- ***device_username*** – Logged on user during the alert. This is filled on a best-effort approach. If the user is not available it may be populated with the device owner
- ***first_event_time*** – Time of the first event in an alert
- ***group_details*** – Group details for when alert grouping is on
- ***id*** – Unique ID for this alert
- ***last_event_time*** – Time of the last event in an alert
- ***last_update_time*** – Time the alert was last updated
- ***legacy_alert_id*** – Unique short ID for this alert. This is deprecated and only available on alerts stored in the old schema.
- ***notes_present*** – Are notes present for this threatId
- ***org_key*** – Unique identifier for the organization to which the alert belongs
- ***policy_id*** – ID of the policy the device was in at the time of the alert
- ***policy_name*** – Name of the policy the device was in at the time of the alert
- ***severity*** – Threat ranking
- ***tags*** – Tags for the alert
- ***target_value*** – Device priority as assigned via the policy
- ***threat_id*** – ID of the threat to which this alert belongs. Threats are comprised of a combination of factors that can be repeated across devices.
- ***type*** – Type of the alert
- ***workflow*** – User-updatable status of the alert

Initialize the BaseAlert object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.
- **initial_data** (*dict*) – Initial data used to populate the alert.

category = None

create_time = None

device_id = None

device_name = None

device_os = None

device_os_version = None

device_username = None

dismiss (*remediation=None*, *comment=None*)
Dismisses this alert.

Parameters

- **remediation** (*str*) – The remediation status to set for the alert.
- **comment** (*str*) – The comment to set for the alert.

dismiss_threat (*remediation=None*, *comment=None*)
Dismisses all alerts with the same threat ID, past or future.

Parameters

- **remediation** (*str*) – The remediation status to set for the alert.
- **comment** (*str*) – The comment to set for the alert.

first_event_time = None

group_details = {}

id = None

last_event_time = None

last_update_time = None

legacy_alert_id = None

notes_present = None

org_key = None

policy_id = None

policy_name = None

primary_key = 'id'

severity = None

tags = []

target_value = None

threat_id = None

type = None

update(*remediation=None*, *comment=None*)
Updates this alert while leaving it open.

Parameters

- **remediation** (*str*) – The remediation status to set for the alert.
- **comment** (*str*) – The comment to set for the alert.

update_threat(*remediation=None*, *comment=None*)
Updates the status of all alerts with the same threat ID, past or future, while leaving them in OPEN state.

Parameters

- **remediation** (*str*) – The remediation status to set for the alert.
- **comment** (*str*) – The comment to set for the alert.

urlobject = '/appservices/v6/orgs/{0}/alerts'

urlobject_single = '/appservices/v6/orgs/{0}/alerts/{1}'

workflow = {}

workflow_
Returns the workflow associated with this alert.

Returns The workflow associated with this alert.

Return type *Workflow*

class BaseAlertSearchQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*

Represents a query that is used to locate BaseAlert objects.

Initialize the BaseAlertSearchQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

VALID_ALERT_TYPES = ['CB_ANALYTICS', 'DEVICE_CONTROL', 'WATCHLIST']

VALID_CATEGORIES = ['THREAT', 'MONITORED', 'INFO', 'MINOR', 'SERIOUS', 'CRITICAL']

VALID_FACET_FIELDS = ['ALERT_TYPE', 'CATEGORY', 'REPUTATION', 'WORKFLOW', 'TAG', 'POLI

VALID_REPUTATIONS = ['KNOWN_MALWARE', 'SUSPECT_MALWARE', 'PUP', 'NOT_LISTED', 'ADAPTIV

VALID_WORKFLOW_VALS = ['OPEN', 'DISMISSED']

dismiss(*remediation=None*, *comment=None*)
Dismiss all alerts matching the given query. The alerts will be left in a DISMISSED state after this request.

Parameters

- **remediation** (*str*) – The remediation state to set for all alerts.
- **comment** (*str*) – The comment to set for all alerts.

Returns The request ID, which may be used to select a WorkflowStatus object.

Return type str

facets (*fieldlist*, *max_rows=0*)
Return information about the facets for this alert by search, using the defined criteria.

Parameters

- **fieldlist** (*list*) – List of facet field names. Valid names are "ALERT_TYPE", "CATEGORY", "REPUTATION", "WORKFLOW", "TAG", "POLICY_ID", "POLICY_NAME", "DEVICE_ID", "DEVICE_NAME", "APPLICATION_HASH", "APPLICATION_NAME", "STATUS", "RUN_STATE", "POLICY_APPLIED_STATE", "POLICY_APPLIED", and "SENSOR_ACTION".
- **max_rows** (*int*) – The maximum number of rows to return. 0 means return all rows.

Returns A list of facet information specified as dicts.

Return type list

set_alert_ids (*alert_ids*)
Restricts the alerts that this query is performed on to the specified alert IDs.

Parameters **alert_ids** (*list*) – List of string alert IDs.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_categories (*categories*)
Restricts the alerts that this query is performed on to the specified categories.

Parameters **categories** (*list*) – List of categories to be restricted to. Valid categories are "THREAT", "MONITORED", "INFO", "MINOR", "SERIOUS", and "CRITICAL."

Returns This instance.

Return type *BaseAlertSearchQuery*

set_create_time (**args*, ***kwargs*)
Restricts the alerts that this query is performed on to the specified creation time.

The time may either be specified as a start and end point or as a range.

Parameters

- ***args** (*list*) – Not used.
- ****kwargs** (*dict*) – Used to specify start= for start time, end= for end time, and range= for range.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_device_ids (*device_ids*)
Restricts the alerts that this query is performed on to the specified device IDs.

Parameters **device_ids** (*list*) – List of integer device IDs.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_device_names (*device_names*)
Restricts the alerts that this query is performed on to the specified device names.

Parameters **device_names** (*list*) – List of string device names.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_device_os(*device_os*)
Restricts the alerts that this query is performed on to the specified device operating systems.

Parameters **device_os** (*list*) – List of string operating systems. Valid values are "WINDOWS", "ANDROID", "MAC", "IOS", "LINUX", and "OTHER."

Returns This instance.

Return type *BaseAlertSearchQuery*

set_device_os_versions(*device_os_versions*)
Restricts the alerts that this query is performed on to the specified device operating system versions.

Parameters **device_os_versions** (*list*) – List of string operating system versions.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_device_username(*users*)
Restricts the alerts that this query is performed on to the specified user names.

Parameters **users** (*list*) – List of string user names.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_group_results(*do_group*)
Specifies whether or not to group the results of the query.

Parameters **do_group** (*bool*) – True to group the results, False to not do so.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_legacy_alert_ids(*alert_ids*)
Restricts the alerts that this query is performed on to the specified legacy alert IDs.

Parameters **alert_ids** (*list*) – List of string legacy alert IDs.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_minimum_severity(*severity*)
Restricts the alerts that this query is performed on to the specified minimum severity level.

Parameters **severity** (*int*) – The minimum severity level for alerts.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_policy_ids(*policy_ids*)
Restricts the alerts that this query is performed on to the specified policy IDs.

Parameters **policy_ids** (*list*) – List of integer policy IDs.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_policy_names(*policy_names*)
Restricts the alerts that this query is performed on to the specified policy names.

Parameters **policy_names** (*list*) – List of string policy names.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_process_names(*process_names*)
Restricts the alerts that this query is performed on to the specified process names.

Parameters **process_names** (*list*) – List of string process names.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_process_sha256(*shas*)
Restricts the alerts that this query is performed on to the specified process SHA-256 hash values.

Parameters **shas** (*list*) – List of string process SHA-256 hash values.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_reputations(*reps*)
Restricts the alerts that this query is performed on to the specified reputation values.

Parameters **reps** (*list*) – List of string reputation values. Valid values are "KNOWN_MALWARE", "SUSPECT_MALWARE", "PUP", "NOT_LISTED", "ADAPTIVE_WHITE_LIST", "COMMON_WHITE_LIST", "TRUSTED_WHITE_LIST",

and "COMPANY_BLACK_LIST".

Returns This instance.

Return type *BaseAlertSearchQuery*

set_tags(*tags*)
Restricts the alerts that this query is performed on to the specified tag values.

Parameters **tags** (*list*) – List of string tag values.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_target_priorities(*priorities*)
Restricts the alerts that this query is performed on to the specified target priority values.

Parameters **priorities** (*list*) – List of string target priority values. Valid values are "LOW", "MEDIUM", "HIGH", and "MISSION_CRITICAL".

Returns This instance.

Return type *BaseAlertSearchQuery*

set_threat_ids(*threats*)
Restricts the alerts that this query is performed on to the specified threat ID values.

Parameters **threats** (*list*) – List of string threat ID values.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_time_range(*key*, ***kwargs*)
Restricts the alerts that this query is performed on to the specified time range.

The time may either be specified as a start and end point or as a range.

Parameters

- **key** (*str*) – The key to use for criteria one of create_time, first_event_time, last_event_time, or last_update_time
- ****kwargs** (*dict*) – Used to specify start= for start time, end= for end time, and range= for range.

Returns This instance.

Return type *BaseAlertSearchQuery*

set_types(*alerttypes*)

Restricts the alerts that this query is performed on to the specified alert type values.

Parameters **alerttypes** (*list*) – List of string alert type values. Valid values are "CB_ANALYTICS", and "WATCHLIST".

Returns This instance.

Return type *BaseAlertSearchQuery*

set_workflows(*workflow_vals*)

Restricts the alerts that this query is performed on to the specified workflow status values.

Parameters **workflow_vals** (*list*) – List of string alert type values. Valid values are "OPEN" and "DISMISSED".

Returns This instance.

Return type *BaseAlertSearchQuery*

sort_by(*key*, *direction='ASC'*)

Sets the sorting behavior on a query's results.

Example

```
>>> cb.select(BaseAlert).sort_by("name")
```

Parameters

- **key** (*str*) – The key in the schema to sort by.
- **direction** (*str*) – The sort order, either "ASC" or "DESC".

Returns This instance.

Return type *BaseAlertSearchQuery*

update(*remediation=None*, *comment=None*)

Update all alerts matching the given query. The alerts will be left in an OPEN state after this request.

Parameters

- **remediation** (*str*) – The remediation state to set for all alerts.
- **comment** (*str*) – The comment to set for all alerts.

Returns The request ID, which may be used to select a WorkflowStatus object.

Return type str

class CBAnalyticsAlert(*cb*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.platform.alerts.BaseAlert*

Represents a CBAnalyticsAlert object in the Carbon Black server.

Initialize the BaseAlert object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.
- **initial_data** (*dict*) – Initial data used to populate the alert.

get_events(*timeout=0*, *async_mode=False*)
Requests enriched events detailed results.

Parameters

- **timeout** (*int*) – Event details request timeout in milliseconds.
- **async_mode** (*bool*) – True to request details in an asynchronous manner.

Returns EnrichedEvents matching the legacy_alert_id

Return type list

Note:

- When using asynchronous mode, this method returns a python future. You can call result() on the future object to wait for completion and get the results.

---

urlobject = '/appservices/v6/orgs/{0}/alerts/cbanalytics'

class CBAnalyticsAlertSearchQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.platform.alerts.BaseAlertSearchQuery*

Represents a query that is used to locate CBAnalyticsAlert objects.

Initialize the CBAnalyticsAlertSearchQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

VALID_KILL_CHAIN_STATUSES = ['RECONNAISSANCE', 'WEAPONIZE', 'DELIVER_EXPLOIT', 'INSTALL

VALID_LOCATIONS = ['ONSITE', 'OFFSITE', 'UNKNOWN']

VALID_POLICY_APPLIED = ['APPLIED', 'NOT_APPLIED']

VALID_RUN_STATES = ['DID_NOT_RUN', 'RAN', 'UNKNOWN']

VALID_SENSOR_ACTIONS = ['POLICY_NOT_APPLIED', 'ALLOW', 'ALLOW_AND_LOG', 'TERMINATE', '

VALID_THREAT_CATEGORIES = ['UNKNOWN', 'NON_MALWARE', 'NEW_MALWARE', 'KNOWN_MALWARE', '

VALID_THREAT_CAUSE_VECTORS = ['EMAIL', 'WEB', 'GENERIC_SERVER', 'GENERIC_CLIENT', 'REM

set_blocked_threat_categories(*categories*)
Restricts the alerts that this query is performed on to the specified threat categories that were blocked.

Parameters **categories** (*list*) – List of threat categories to look for. Valid values are "UNKNOWN", "NON_MALWARE", "NEW_MALWARE", "KNOWN_MALWARE", and "RISKY_PROGRAM".

Returns This instance.

Return type *CBAnalyticsAlertSearchQuery*

set_device_locations(*locations*)
Restricts the alerts that this query is performed on to the specified device locations.

Parameters **locations** (*list*) – List of device locations to look for. Valid values are "ON-SITE", "OFFSITE", and "UNKNOWN".

Returns This instance.

Return type *CBAnalyticsAlertSearchQuery*

set_kill_chain_statuses(*statuses*)
Restricts the alerts that this query is performed on to the specified kill chain statuses.

Parameters **statuses** (*list*) – List of kill chain statuses to look for. Valid values are "RECONNAISSANCE", "WEAPONIZE", "DELIVER_EXPLOIT", "IN-STALL_RUN","COMMAND_AND_CONTROL", "EXECUTE_GOAL", and "BREACH".

Returns This instance.

Return type *CBAnalyticsAlertSearchQuery*

set_not_blocked_threat_categories(*categories*)
Restricts the alerts that this query is performed on to the specified threat categories that were NOT blocked.

Parameters **categories** (*list*) – List of threat categories to look for. Valid values are "UNKNOWN", "NON_MALWARE", "NEW_MALWARE", "KNOWN_MALWARE", and "RISKY_PROGRAM".

Returns This instance.

Return type *CBAnalyticsAlertSearchQuery*

set_policy_applied(*applied_statuses*)
Restricts the alerts that this query is performed on to the specified policy status values.

Parameters **applied_statuses** (*list*) – List of status values to look for. Valid values are "APPLIED" and "NOT_APPLIED".

Returns This instance.

Return type *CBAnalyticsAlertSearchQuery*

set_reason_code(*reason*)
Restricts the alerts that this query is performed on to the specified reason codes (enum values).

Parameters **reason** (*list*) – List of string reason codes to look for.

Returns This instance.

Return type *CBAnalyticsAlertSearchQuery*

set_run_states(*states*)
Restricts the alerts that this query is performed on to the specified run states.

Parameters **states** (*list*) – List of run states to look for. Valid values are "DID_NOT_RUN", "RAN", and "UNKNOWN".

Returns This instance.

Return type *CBAnalyticsAlertSearchQuery*

set_sensor_actions(*actions*)
Restricts the alerts that this query is performed on to the specified sensor actions.

Parameters **actions** (*list*) – List of sensor actions to look for. Valid values are "POLICY_NOT_APPLIED", "ALLOW", "ALLOW_AND_LOG", "TERMINATE", and "DENY".

Returns This instance.

Return type *CBAnalyticsAlertSearchQuery*

set_threat_cause_vectors(*vectors*)
Restricts the alerts that this query is performed on to the specified threat cause vectors.

Parameters **vectors** (*list*) – List of threat cause vectors to look for. Valid values are "EMAIL", "WEB", "GENERIC_SERVER", "GENERIC_CLIENT", "REMOTE_DRIVE", "REMOVABLE_MEDIA", "UNKNOWN", "APP_STORE", and "THIRD_PARTY".

Returns This instance.

Return type *CBAnalyticsAlertSearchQuery*

class DeviceControlAlert(*cb*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.platform.alerts.BaseAlert*

Represents a DeviceControlAlert object in the Carbon Black server.

Initialize the BaseAlert object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.
- **initial_data** (*dict*) – Initial data used to populate the alert.

urlobject = '/appservices/v6/orgs/{0}/alerts/devicecontrol'

class DeviceControlAlertSearchQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.platform.alerts.BaseAlertSearchQuery*

Represents a query that is used to locate DeviceControlAlert objects.

Initialize the CBAnalyticsAlertSearchQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

set_external_device_friendly_names(*names*)
Restricts the alerts that this query is performed on to the specified external device friendly names.

Parameters **names** (*list*) – List of external device friendly names to look for.

Returns This instance.

Return type *DeviceControlAlertSearchQuery*

set_external_device_ids(*ids*)
Restricts the alerts that this query is performed on to the specified external device IDs.

Parameters **ids** (*list*) – List of external device IDs to look for.

Returns This instance.

Return type *DeviceControlAlertSearchQuery*

set_product_ids(*ids*)
Restricts the alerts that this query is performed on to the specified product IDs.

Parameters **ids** (*list*) – List of product IDs to look for.

Returns This instance.

Return type *DeviceControlAlertSearchQuery*

set_product_names(*names*)
Restricts the alerts that this query is performed on to the specified product names.

Parameters **names** (*list*) – List of product names to look for.

Returns This instance.

Return type *DeviceControlAlertSearchQuery*

set_serial_numbers(*serial_numbers*)
Restricts the alerts that this query is performed on to the specified serial numbers.

Parameters **serial_numbers** (*list*) – List of serial numbers to look for.

Returns This instance.

Return type *DeviceControlAlertSearchQuery*

set_vendor_ids(*ids*)
Restricts the alerts that this query is performed on to the specified vendor IDs.

Parameters **ids** (*list*) – List of vendor IDs to look for.

Returns This instance.

Return type *DeviceControlAlertSearchQuery*

set_vendor_names(*names*)
Restricts the alerts that this query is performed on to the specified vendor names.

Parameters **names** (*list*) – List of vendor names to look for.

Returns This instance.

Return type *DeviceControlAlertSearchQuery*

class WatchlistAlert(*cb*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.platform.alerts.BaseAlert*

Represents a WatchlistAlert object in the Carbon Black server.

Initialize the BaseAlert object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.
- **initial_data** (*dict*) – Initial data used to populate the alert.

urlobject = '/appservices/v6/orgs/{0}/alerts/watchlist'

class WatchlistAlertSearchQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.platform.alerts.BaseAlertSearchQuery*

Represents a query that is used to locate WatchlistAlert objects.

Initialize the WatchlistAlertSearchQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

set_watchlist_ids(*ids*)
Restricts the alerts that this query is performed on to the specified watchlist ID values.

Parameters **ids** (*list*) – List of string watchlist ID values.

Returns This instance.

Return type *WatchlistAlertSearchQuery*

set_watchlist_names(*names*)
Restricts the alerts that this query is performed on to the specified watchlist name values.

Parameters **names** (*list*) – List of string watchlist name values.

Returns This instance.

Return type *WatchlistAlertSearchQuery*

class Workflow(*cb*, *initial_data=None*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Workflow object in the Carbon Black server.

Variables

- ***changed_by*** – Username of the user who changed the workflow
- ***comment*** – Comment when updating the workflow
- ***last_update_time*** – When the workflow was last updated
- ***remediation*** – Alert remediation code. Indicates the result of the investigation into the alert
- ***state*** – State of the workflow

Initialize the Workflow object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **initial_data** (*dict*) – Initial data used to populate the workflow.

changed_by = None

comment = None

last_update_time = None

remediation = None

state = None

class WorkflowStatus(*cb*, *model_unique_id*, *initial_data=None*)

Bases: *cbc_sdk.platform.base.PlatformModel*

Represents a WorkflowStatus object in the Carbon Black server.

Variables

- ***errors*** – Errors for dismiss alerts or threats, if no errors it won't be included in response
- ***failed_ids*** – Failed ids
- ***id*** – Time based id for async job, it's not unique across the orgs
- ***num_hits*** – Total number of alerts to be operated on
- ***num_success*** – Successfully operated number of alerts
- ***status*** – Status for the async progress
- ***workflow*** – Requested workflow change

Initialize the BaseAlert object.

Parameters

- **cb** (*BaseAPI*) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the request being processed.
- **initial_data** (*dict*) – Initial data used to populate the status.

errors = []

failed_ids = []

finished

Returns whether this request has been completed.

Returns True if the request is in "finished" state, False if not.

Return type bool

id = None

id_

Returns the request ID of the associated request.

Returns The request ID of the associated request.

Return type str

in_progress

Returns whether this request is currently in progress.

Returns True if the request is in "in progress" state, False if not.

Return type bool

num_hits = None

num_success = None

primary_key = 'id'

queued

Returns whether this request has been queued.

Returns True if the request is in "queued" state, False if not.

Return type bool

status = None

urlobject_single = '/appservices/v6/orgs/{0}/workflow/status/{1}'

workflow = {}

workflow_
Returns the current workflow associated with this request.

Returns The current workflow associated with this request.

Return type *Workflow*

4.6.3 cbc_sdk.platform.base module

Model and Query Classes for Platform

class PlatformModel(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=False*)
Bases: *cbc_sdk.base.NewBaseModel*

Represents a PlatformModel object in the Carbon Black server.

Initialize the PlatformModel object.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **model_unique_id** (*Any*) – The unique ID for this particular instance of the model object.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

log = <Logger cbc_sdk.platform.base (WARNING)>
Platform Models

4.6.4 cbc_sdk.platform.devices module

Model and Query Classes for Platform Devices

class Device(*cb*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.platform.base.PlatformModel*

Represents a Device object in the Carbon Black server.

Variables

- ***activation_code*** – Device activation code
- ***activation_code_expiry_time*** – When the expiration code expires and cannot be used to register a device
- ***ad_group_id*** – Device's AD group
- ***av_ave_version*** – AVE version (part of AV Version)
- ***av_engine*** – Current AV version
- ***av_last_scan_time*** – Last AV scan time

- ***av_master*** – Whether the device is an AV Master (?)
- ***av_pack_version*** – Pack version (part of AV Version)
- ***av_product_version*** – AV Product version (part of AV Version)
- ***av_status*** – AV Statuses
- ***av_update_servers*** – Device's AV servers
- ***av_vdf_version*** – VDF version (part of AV Version)
- ***current_sensor_policy_name*** – Current MSM policy name
- ***deregistered_time*** – When the device was deregistered with the PSC backend
- ***device_id*** – ID of the device
- ***device_meta_data_item_list*** – MSM Device metadata
- ***device_owner_id*** – ID of the user who owns the device
- ***email*** – Email of the user who owns the device
- ***encoded_activation_code*** – Encoded device activation code
- ***first_name*** – First name of the user who owns the device
- ***id*** – ID of the device
- ***last_contact_time*** – Time the device last checked into the PSC backend
- ***last_device_policy_changed_time*** – Last time the device's policy was changed
- ***last_device_policy_requested_time*** – Last time the device requested policy updates
- ***last_external_ip_address*** – Device's external IP
- ***last_internal_ip_address*** – Device's internal IP
- ***last_location*** – Location of the device (on-/off-premises)
- ***last_name*** – Last name of the user who owns the device
- ***last_policy_updated_time*** – Last time the device was MSM processed
- ***last_reported_time*** – Time when device last reported an event to PSC backend
- ***last_reset_time*** – When the sensor was last reset
- ***last_shutdown_time*** – When the device last shut down
- ***linux_kernel_version*** – Linux kernel version
- ***login_user_name*** – Last acive logged in username
- ***mac_address*** – Device's hardware MAC address
- ***middle_name*** – Middle name of the user who owns the device
- ***name*** – Device Hostname
- ***organization_id*** – Org ID to which the device belongs
- ***organization_name*** – Name of the org that owns this device
- ***os*** – Device type
- ***os_version*** – Version of the OS

- ***passive_mode*** – Whether the device is in passive mode (bypass?)
- ***policy_id*** – ID of the policy this device is using
- ***policy_name*** – Name of the policy this device is using
- ***policy_override*** – Manually assigned policy (overrides mass sensor management)
- ***quarantined*** – Whether the device is quarantined
- ***registered_time*** – When the device was registered with the PSC backend
- ***scan_last_action_time*** – When the background scan was last active
- ***scan_last_complete_time*** – When the background scan was last completed
- ***scan_status*** – Background scan status
- ***sensor_out_of_date*** – Whether the device is out of date
- ***sensor_states*** – Active sensor states
- ***sensor_version*** – Version of the PSC sensor
- ***status*** – Device status
- ***target_priority_type*** – Priority of the device
- ***uninstall_code*** – Code to enter to uninstall this device
- ***vdi_base_device*** – VDI Base device
- ***virtual_machine*** – Whether this device is a Virtual Machine (VMware AppDefense integration
- ***virtualization_provider*** – VM Virtualization Provider
- ***windows_platform*** – Type of windows platform (client/server, x86/x64)
- ***deployment_type*** – Classification determined by the device lifecycle management policy

Initialize the Device object.

Parameters

- **cb** (*BaseAPI*) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.
- **initial_data** (*dict*) – Initial data used to populate the alert.

activation_code = None

activation_code_expiry_time = None

ad_group_id = None

av_ave_version = None

av_engine = None

av_last_scan_time = None

av_master = None

av_pack_version = None

av_product_version = None

av_status = []

av_update_servers = []

av_vdf_version = None

background_scan(*flag*)
Set the background scan option for this device.

Parameters **flag** (*bool*) – True to turn background scan on, False to turn it off.

Returns The JSON output from the request.

Return type str

bypass(*flag*)
Set the bypass option for this device.

Parameters **flag** (*bool*) – True to enable bypass, False to disable it.

Returns The JSON output from the request.

Return type str

current_sensor_policy_name = None

delete_sensor()
Delete this sensor device.

Returns The JSON output from the request.

Return type str

deployment_type = None

deregistered_time = None

deviceId
Warn user that Platform Devices use 'id', not 'device_id'.

Platform Device API's return 'id' in API responses, where Endpoint Standard API's return 'deviceId'.

device_id = None

device_meta_data_item_list = []

device_owner_id = None

email = None

encoded_activation_code = None

first_name = None

get_vulnerability_summary(*category=None*)
Get the vulnerabilities associated with this device

Parameters **category** (*string*) – (optional) vulnerabilty category (OS, APP)

Returns summary for the vulnerabilities for this device

Return type dict

get_vulnerabilties()
Get an Operating System or Application Vulnerability List for a specific device.

Returns vulnerabilities for this device

Return type dict

id = None

last_contact_time = None

last_device_policy_changed_time = None

last_device_policy_requested_time = None

last_external_ip_address = None

last_internal_ip_address = None

last_location = None

last_name = None

last_policy_updated_time = None

last_reported_time = None

last_reset_time = None

last_shutdown_time = None

linux_kernel_version = None

login_user_name = None

lr_session(*async_mode=False*)

Retrieve a Live Response session object for this Device.

Returns Live Response session for the Device.

Return type *LiveResponseSession*

Raises `ApiError` – If there is an error establishing a Live Response session for this Device.

mac_address = None

middle_name = None

name = None

organization_id = None

organization_name = None

os = None

os_version = None

passive_mode = None

policy_id = None

policy_name = None

policy_override = None

primary_key = 'id'

quarantine(*flag*)

Set the quarantine option for this device.

Parameters **flag** (*bool*) – True to enable quarantine, False to disable it.

Returns The JSON output from the request.

Return type str

quarantined = None

registered_time = None

scan_last_action_time = None

scan_last_complete_time = None

scan_status = None

sensor_out_of_date = None

sensor_states = []

sensor_version = None

status = None

target_priority_type = None

uninstall_code = None

uninstall_sensor()
Uninstall this sensor device.

Returns The JSON output from the request.

Return type str

update_policy(*policy_id*)
Set the current policy for this device.

Parameters **policy_id** (*int*) – ID of the policy to set for the devices.

Returns The JSON output from the request.

Return type str

update_sensor_version(*sensor_version*)
Update the sensor version for this device.

Parameters **sensor_version** (*dict*) – New version properties for the sensor.

Returns The JSON output from the request.

Return type str

urlobject = '/appservices/v6/orgs/{0}/devices'

urlobject_single = '/appservices/v6/orgs/{0}/devices/{1}'

vdi_base_device = None

virtual_machine = None

virtualization_provider = None

vulnerability_refresh()
Perform an action on a specific device. Only REFRESH is supported.

windows_platform = None

class DeviceSearchQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*

Represents a query that is used to locate Device objects.

Initialize the DeviceSearchQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

VALID_DEPLOYMENT_TYPES = ['ENDPOINT', 'WORKLOAD']

VALID_DIRECTIONS = ['ASC', 'DESC']

VALID_OS = ['WINDOWS', 'ANDROID', 'MAC', 'IOS', 'LINUX', 'OTHER']

VALID_PRIORITIES = ['LOW', 'MEDIUM', 'HIGH', 'MISSION_CRITICAL']

VALID_STATUSES = ['PENDING', 'REGISTERED', 'UNINSTALLED', 'DEREGISTERED', 'ACTIVE', 'I

background_scan(*scan*)
Set the background scan option for the specified devices.

Parameters **scan** (*bool*) – True to turn background scan on, False to turn it off.

Returns The JSON output from the request.

Return type str

bypass(*enable*)
Set the bypass option for the specified devices.

Parameters **enable** (*bool*) – True to enable bypass, False to disable it.

Returns The JSON output from the request.

Return type str

delete_sensor()
Delete the specified sensor devices.

Returns The JSON output from the request.

Return type str

download()
Uses the query parameters that have been set to download all device listings in CSV format.

Example

```
>>> cb.select(Device).set_status(["ALL"]).download()
```

Returns The CSV raw data as returned from the server.

Return type str

Raises ApiError – If status values have not been set before calling this function.

quarantine(*enable*)
Set the quarantine option for the specified devices.

Parameters **enable** (*bool*) – True to enable quarantine, False to disable it.

Returns The JSON output from the request.

Return type str

set_ad_group_ids(*ad_group_ids*)
Restricts the devices that this query is performed on to the specified AD group IDs.

Parameters **ad_group_ids** (*list*) – List of AD group IDs to restrict the search to.

Returns This instance.

Return type *DeviceSearchQuery*

Raises `ApiError` – If invalid (non-int) values are passed in the list.

set_deployment_type(*deployment_type*)
Restricts the devices that this query is performed on to the specified deployment types.

Parameters **deployment_type** (*list*) – List of deployment types to restrict search to.

Returns This instance.

Return type *DeviceSearchQuery*

Raises `ApiError` – If invalid deployment type values are passed in the list.

set_device_ids(*device_ids*)
Restricts the devices that this query is performed on to the specified device IDs.

Parameters **device_ids** (*list*) – List of device IDs to restrict the search to.

Returns This instance.

Return type *DeviceSearchQuery*

Raises `ApiError` – If invalid (non-int) values are passed in the list.

set_exclude_sensor_versions(*sensor_versions*)
Restricts the devices that this query is performed on to exclude specified sensor versions.

Parameters **sensor_versions** (*list*) – List of sensor versions to be excluded.

Returns This instance.

Return type *DeviceSearchQuery*

Raises `ApiError` – If invalid (non-string) values are passed in the list.

set_last_contact_time(**args*, ***kwargs*)
Restricts the devices that this query is performed on to the specified last contact time.

Parameters

- ***args** (*list*) – Not used, retained for compatibility.
- ****kwargs** (*dict*) – Keyword arguments to this function. The critical ones are "start" (the start time), "end" (the end time), and "range" (the range value).

Returns This instance.

Return type *DeviceSearchQuery*

Raises `ApiError` – If an invalid combination of keyword parameters are specified.

set_max_rows(*max_rows*)
Sets the max number of devices to fetch in a singular query

Parameters **max_rows** (*integer*) – Max number of devices

Returns This instance.

Return type *DeviceSearchQuery*

Raises `ApiError` – If rows is negative or greater than 10000

set_os(*operating_systems*)
Restricts the devices that this query is performed on to the specified operating systems.

Parameters **operating_systems** (*list*) – List of operating systems to restrict search to. Valid values in this list are "WINDOWS", "ANDROID", "MAC", "IOS", "LINUX", and "OTHER".

Returns This instance.

Return type *DeviceSearchQuery*

Raises ApiError – If invalid operating system values are passed in the list.

set_policy_ids(*policy_ids*)
Restricts the devices that this query is performed on to the specified policy IDs.

Parameters **policy_ids** (*list*) – List of policy IDs to restrict the search to.

Returns This instance.

Return type *DeviceSearchQuery*

Raises ApiError – If invalid (non-int) values are passed in the list.

set_status(*statuses*)
Restricts the devices that this query is performed on to the specified status values.

Parameters **statuses** (*list*) – List of statuses to restrict search to. Valid values in this list are "PENDING", "REGISTERED", "UNINSTALLED", "DEREGISTERED", "ACTIVE", "INACTIVE", "ERROR", "ALL", "BYPASS_ON", "BYPASS", "QUARANTINE", "SENSOR_OUTOFDATE", "DELETED", and "LIVE".

Returns This instance.

Return type *DeviceSearchQuery*

Raises ApiError – If invalid status values are passed in the list.

set_target_priorities(*target_priorities*)
Restricts the devices that this query is performed on to the specified target priority values.

Parameters **target_priorities** (*list*) – List of priorities to restrict search to. Valid values in this list are "LOW", "MEDIUM", "HIGH", and "MISSION_CRITICAL".

Returns This instance.

Return type *DeviceSearchQuery*

Raises ApiError – If invalid priority values are passed in the list.

sort_by(*key*, *direction='ASC'*)
Sets the sorting behavior on a query's results.

Example

```
>>> cb.select(Device).sort_by("status")
```

Parameters

- **key** (*str*) – The key in the schema to sort by.
- **direction** (*str*) – The sort order, either "ASC" or "DESC".

Returns This instance.

Return type *DeviceSearchQuery*

Raises ApiError – If an invalid direction value is passed.

uninstall_sensor()
Uninstall the specified sensor devices.

Returns The JSON output from the request.

Return type str

update_policy(*policy_id*)
Set the current policy for the specified devices.

Parameters **policy_id** (*int*) – ID of the policy to set for the devices.

Returns The JSON output from the request.

Return type str

update_sensor_version(*sensor_version*)
Update the sensor version for the specified devices.

Parameters **sensor_version** (*dict*) – New version properties for the sensor.

Returns The JSON output from the request.

Return type str

4.6.5 cbc_sdk.platform.events module

Model and Query Classes for Events

class Event(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=True*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Event object in the Carbon Black server.

Initialize the Event object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **model_unique_id** (*str*) – The unique ID for this particular instance of the model object.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

default_sort = 'last_update desc'

primary_key = 'process_guid'

urlobject = '/api/investigate/v2/orgs/{}/events/{}/_search'

validation_url = '/api/investigate/v1/orgs/{}/events/search_validation'

class EventFacet(*cb*, *model_unique_id*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a EventFacet object in the Carbon Black server.

Initialize an EventFacet object with initial_data.

class Ranges(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Ranges object in the Carbon Black server.

Initialize a ProcessFacet Ranges object with initial_data.

facets
Returns the reified *EventFacet.Terms._facets* for this result.

fields
Returns the ranges fields for this result.

class Terms(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Terms object in the Carbon Black server.

Initialize a ProcessFacet Terms object with initial_data.

facets
Returns the terms' facets for this result.

fields
Returns the terms facets' fields for this result.

primary_key = 'process_guid'

ranges_
Returns the reified *EventFacet.Ranges* for this result.

terms_
Returns the reified *EventFacet.Terms* for this result.

urlobject = '/api/investigate/v2/orgs/{}/events/{}/_facet'

class EventFacetQuery(*cls*, *cb*, *query=None*)
Bases: *cbc_sdk.base.FacetQuery*

Represents the logic for an Event Facet query.

Initialize the FacetQuery object.

class EventQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.Query*

Represents the logic for an Event query.

Initialize the Query object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

4.6.6 cbc_sdk.platform.grants module

Model and Query Classes for Administrative Grants and Profiles

class Grant(*cb*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.base.MutableBaseModel*

Represents a Grant object in the Carbon Black server.

Variables

- ***principal*** – URN of principal
- ***expires*** – Date and time the grant expires
- ***revoked*** – True if this grant has been/is being revoked
- ***roles*** – URNs of roles assigned to grant (obsolete)
- ***profiles*** – Profiles assigned to this grant
- ***org_ref*** – URN of org that this grant references
- ***principal_name*** – Name of principal
- ***created_by*** – URN of user that created this grant
- ***updated_by*** – URN of user that last updated this grant
- ***create_time*** – Date and time the grant was created
- ***update_time*** – Date and time the grant was last updated
- ***can_manage*** – True if can manage (TBD)

Initialize the Grant object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – URN of the principal associated with this grant.
- **initial_data** (*dict*) – Initial data used to populate the grant.

class GrantBuilder(*cb*, *principal*)

Bases: object

Auxiliary object used to construct a new grant.

Creates the empty GrantBuilder object.

Parameters

- **cb** (CBCloudAPI) – The reference to the API object that accesses the server.
- **principal** (*str*) – The URN for the principal.

add_role(*role*)

Adds a role to be associated with the new grant.

Parameters **role** (*str*) – URN of the role to be added.
Returns This object.
Return type *GrantBuilder*

build()

Builds the new Grant object from the entered data.

Returns The new Grant object.
Return type *Grant*

create_profile(*template=None*)

Returns either a new Profile, or a ProfileBuilder to begin the process of adding profile to the new grant.

Parameters **template** (*dict*) – Optional template to use for creating the profile object.
Returns

If a template was specified, return the new Profile object. ProfileBuilder: If template was None, returns a ProfileBuilder object. Call methods on it to set
up the new profile, and then call build() to create the new profile.

Return type *Profile*

set_org(*org*)
Sets the organization reference to be associated with the new grant.
Parameters **org** (*str*) – Organization key or URN of the organization.
Returns This object.
Return type *GrantBuilder*

set_principal_name(*name*)
Sets the principal name to be associated with the new object.
Parameters **name** (*str*) – Principal name to be used.
Returns This object.
Return type *GrantBuilder*

set_roles(*roles*)
Sets the roles to be associated with the new grant.
Parameters **roles** (*list*) – List of role URNs.
Returns This object.
Return type *GrantBuilder*

class Profile(*cb*, *grant*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.base.MutableBaseModel*

Represents a Profile object in the Carbon Black server.

Variables

- ***profile_uuid*** – UUID identifying this profile
- ***orgs*** – Organization references for this profile
- ***org_groups*** – Organization groups added to this grant (TBD)
- ***roles*** – URNs of roles assigned to profile
- ***conditions*** – Access conditions to be imposed on this profile
- ***can_manage*** – True if can manage (TBD)

Initialize the Profile object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **grant** (Grant) – Reference to the Grant containing this Profile.
- **model_unique_id** (*str*) – UUID of this profile.
- **initial_data** (*dict*) – Initial data used to populate the profile.

allowed_orgs
Returns the list of organization URNs allowed by this profile.

can_manage = None

conditions = {}

matches_template(*template*)
Returns whether or not the profile matches the given template.
Parameters **template** (*dict*) – The profile template to match against.
Returns True if this profile matches the template, False if not.
Return type bool

org_groups = []

orgs = {}

primary_key = 'profile_uuid'

profile_uuid = None

roles = []

set_disabled(*flag*)
Sets the "disabled" flag on a profile.
Parameters **flag** (*bool*) – True to disable the profile, False to enable it.

set_expiration(*expiration*)
Sets the expiration time on a profile.
Parameters **expiration** (*str*) – Expiration time to set on the profile (ISO 8601 format).

urlobject = '/access/v2/orgs/{0}/grants/{1}/profiles'

urlobject_single = '/access/v2/orgs/{0}/grants/{1}/profiles/{2}'

class ProfileBuilder(*grant*)
Bases: object

Auxiliary object used to construct a new profile on a grant.

Create the empty ProfileBuilder object.

Parameters **grant** (*Grant/GrantBuilder*) – The grant or GrantBuilder the new profile will be attached to.

add_org(*org*)
Adds the specified organization to the list of organizations for which the new profile is allowed.
Parameters **org** (*str*) – Organization key or URN of the organization to be added.
Returns This object.
Return type *ProfileBuilder*

add_role(*role*)
Adds a role identifier to the list of roles associated with the new profile.
Parameters **role** (*str*) – URN of the role to add.
Returns This object.
Return type *ProfileBuilder*

build()
Builds the new Profile object from the entered data.
Returns The new Profile object.
Return type *Profile*

set_conditions(*conditions_structure*)
Sets the access conditions associated with the new profile.
Parameters **conditions_structure** (*dict*) – The conditions associated with the new profile, with 'cidr', 'expiration', and 'disabled' members.
Returns This object.
Return type *ProfileBuilder*

set_disabled(*flag*)
Sets whether or not the new profile is disabled.
Parameters **flag** (*bool*) – True if this profile is disabled, False if noe.
Returns This object.
Return type *ProfileBuilder*

set_expiration(*expiration*)
Sets the expiration time on the new profile.
Parameters **expiration** (*str*) – The expiration time, specified as ISO 8601.
Returns This object.

Return type *ProfileBuilder*

set_orgs(*orgs_list*)
Set the list of organizations to which the new profile is allowed access.
Parameters **orgs_list** (*list*) – List of organization keys or URNs.
Returns This object.
Return type *ProfileBuilder*

set_roles(*roles_list*)
Sets the list of roles associated with the new profile.
Parameters **roles_list** (*list*) – A list of role URNs.
Returns This object.
Return type *ProfileBuilder*

can_manage = None

classmethod create(*cb*, *template=None*, ***kwargs*)
Returns either a new Grant, or a GrantBuilder to begin the process of creating a new grant.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **template** (*dict*) – Optional template to use for creating the grant object.
- **kwargs** (*dict*) – Additional arguments to be used to specify the principal, if template is None. The arguments to be used are 'org_key' and 'userid' for the two parts of the ID.

Returns

The new grant object, if the template is specified. GrantBuilder: If template was None, returns a GrantBuilder object. Call methods on it to set

up the new grant, and then call build() to create the new grant.

Return type *Grant*

Raises ApiError – If the principal is inadequately specified (whether for the Grant or GrantBuilder).

create_profile(*template=None*)
Returns either a new Profile, or a ProfileBuilder to begin the process of adding a new profile to this grant.

Parameters **template** (*dict*) – Optional template to use for creating the profile object.

Returns

If a template was specified, return the new Profile object. ProfileBuilder: If template was None, returns a ProfileBuilder object. Call methods on it to set

up the new profile, and then call build() to create the new profile.

Return type *Profile*

create_time = None

created_by = None

expires = None

classmethod get_permitted_role_urns(*cb*)
Returns a list of the URNs of all permitted roles that we can assign to a user.

Parameters **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

Returns A list of string role URNs that we are permitted to manage (assign to users).

Return type list

org_ref = None

primary_key = 'principal'

principal = None

principal_name = None

profiles = []

profiles_
Return the profiles associated with this grant.

Returns The profiles associated with this grant, each represented as a Profile object.

Return type list

revoked = None

roles = []

update_time = None

updated_by = None

urlobject = '/access/v2/orgs/{0}/grants'

urlobject_single = '/access/v2/orgs/{0}/grants/{1}'

class GrantQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*

Query for retrieving grants in bulk.

Initialize the Query object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

add_principal(*principal_urn*, *org_urn*)
Add a new principal to the query.

Parameters

- **principal_urn** (*str*) – URN of the principal to search for grants on.
- **org_urn** (*str*) – URN of the organization to which the principal belongs.

Returns This object.

Return type *GrantQuery*

log = <Logger cbc_sdk.platform.grants (WARNING)>
Grant and Profile Models

normalize_org(*org*)
Internal function to normalize an org reference to a URN.

4.6.7 cbc_sdk.platform.processes module

Model and Query Classes for Processes

class AsyncProcessQuery(*doc_class*, *cb*)

Bases: *cbc_sdk.base.Query*

Represents the query logic for an asychronous Process query.

This class specializes *Query* to handle the particulars of process querying.

Initialize the AsyncProcessQuery object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

set_rows(*rows*)

Sets the 'rows' query parameter to the 'results' API call, determining how many rows to request per batch.

This will not limit the total results to rows instead the batch size will use rows and all of the num_available will be fetched.

Parameters **rows** (*int*) – How many rows to request.

timeout(*msecs*)

Sets the timeout on a process query.

Parameters **msecs** (*int*) – Timeout duration, in milliseconds.

Returns

The Query object with new milliseconds parameter.

Return type *Query* (*AsyncProcessQuery*)

Example:

```
>>> cb.select(Process).where(process_name="foo.exe").timeout(5000)
```

class Process(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=False*)

Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Process object in the Carbon Black server.

Initialize the Process object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **model_unique_id** (*str*) – The unique ID (GUID) for this process.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

class Summary(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=True*)

Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Summary object in the Carbon Black server.

Initialize the Summary object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **model_unique_id** (*str*) – The unique ID for this particular instance of the model object.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

```
SHOW_ATTR = {'children':  {'fields':  ['process_name', 'process_guid', 'process_has
```

```
default_sort = 'last_update desc'
```

```
primary_key = 'process_guid'
```

```
result_url = '/api/investigate/v2/orgs/{}/processes/summary_jobs/{}/results'
```

```
summary_format = 'summary'
```

```
urlobject = '/api/investigate/v2/orgs/{}/processes/summary_jobs'
```

class Tree(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=True*)

Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Tree object in the Carbon Black server.

Initialize the Tree object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **model_unique_id** (*str*) – The unique ID for this particular instance of the model object.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

```
SHOW_ATTR = {'children':  ['process_name', 'process_guid', 'process_hash', 'process
```

```
default_sort = 'last_update desc'
```

```
primary_key = 'process_guid'
```

```
result_url = '/api/investigate/v2/orgs/{}/processes/summary_jobs/{}/results'
```

```
summary_format = 'tree'
```

```
urlobject = '/api/investigate/v2/orgs/{}/processes/summary_jobs'
```

approve_process_sha256(*description=''*)

Approves the application by adding the process_sha256 to the WHITE_LIST

Parameters **description** – The justification for why the application was added to the WHITE_LIST

Returns

ReputationOverride object created in the Carbon Black Cloud

Return type *ReputationOverride* (cbc_sdk.platform.ReputationOverride)

ban_process_sha256(*description=''*)
Bans the application by adding the process_sha256 to the BLACK_LIST

Parameters **description** – The justification for why the application was added to the BLACK_LIST

Returns

ReputationOverride object created in the Carbon Black Cloud

Return type *ReputationOverride* (cbc_sdk.platform.ReputationOverride)

children
Returns a list of child processes for this process.

Returns

List of Processes, one for each child of the parent Process.

Return type children ([*Process*])

default_sort = 'last_update desc'

events(***kwargs*)
Returns a query for events associated with this process's process GUID.

Parameters **kwargs** – Arguments to filter the event query with.

Returns

Query object with the appropriate search parameters for events

Return type query (cbc_sdk.enterprise_edr.Query)

Example:

```
>>> [print(event) for event in process.events()]
>>> [print(event) for event in process.events(event_type="modload")]
```

facets()
Returns a FacetQuery for a Process.

This represents the search for a summary of result groupings (facets). The returned AsyncFacetQuery object must have facet fields or ranges specified before it can be submitted, using the *add_facet_field()* or *add_range()* methods.

get_details(*timeout=0*, *async_mode=False*)
Requests detailed results.

Parameters

- **timeout** (*int*) – Event details request timeout in milliseconds.
- **async_mode** (*bool*) – True to request details in an asynchronous manner.

Note:

- When using asynchronous mode, this method returns a python future. You can call result() on the future object to wait for completion and get the results.

---

parents
Returns a parent process associated with this process.

Returns Parent Process if one exists, None if the process has no recorded parent.

Return type parent (*Process*)

primary_key = 'process_guid'

process_md5
Returns a string representation of the MD5 hash for this process.

Returns MD5 hash of the process.

Return type hash (str)

process_pids
Returns a list of PIDs associated with this process.

Returns List of integer PIDs. None if there are no associated PIDs.

Return type pids ([int])

process_sha256
Returns a string representation of the SHA256 hash for this process.

Returns SHA256 hash of the process.

Return type hash (str)

siblings
Returns a list of sibling processes for this process.

Returns

List of Processes, one for each sibling of the parent Process.

Return type siblings ([*Process*])

summary
Returns organization-specific information about this process.

tree
Returns a Process Tree associated with this process.

Returns Tree with children (and possibly siblings).

Return type *Tree* (cbc_sdk.enterprise_edr.Tree)

Example:

```
>>> tree = process.tree
```

urlobject = ''

validation_url = '/api/investigate/v1/orgs/{}/processes/search_validation'

class ProcessFacet(*cb*, *model_unique_id*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a ProcessFacet object in the Carbon Black server.

Variables

- ***job_id*** – The Job ID assigned to this query
- ***terms*** – Contains the Process Facet search results
- ***ranges*** – Groupings for search result properties that are ISO 8601 timestamps or numbers
- ***contacted*** – The number of searchers contacted for this query
- ***completed*** – The number of searchers that have reported their results

Initialize a ResultFacet object with initial_data.

class Ranges(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Ranges object in the Carbon Black server.

Initialize a ProcessFacet Ranges object with initial_data.

facets
Returns the reified *ProcessFacet.Terms._facets* for this result.

fields
Returns the ranges fields for this result.

class Terms(*cb*, *initial_data*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a Terms object in the Carbon Black server.

Initialize a ProcessFacet Terms object with initial_data.

facets
Returns the terms' facets for this result.

fields
Returns the terms facets' fields for this result.

completed = None

contacted = None

job_id = None

num_found = None

primary_key = 'job_id'

ranges = []

ranges_
Returns the reified *ProcessFacet.Ranges* for this result.

result_url = '/api/investigate/v2/orgs/{}/processes/facet_jobs/{}/results'

submit_url = '/api/investigate/v2/orgs/{}/processes/facet_jobs'

terms = {}

terms_
Returns the reified *ProcessFacet.Terms* for this result.

class SummaryQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.AsyncQueryMixin*, *cbc_sdk.base.QueryBuilderSupportMixin*

Represents the logic for a Process Summary or Process Tree query.

Initialize the SummaryQuery object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

results
Save query results to self._results with self._search() method.

set_time_range(*start=None*, *end=None*, *window=None*)
Sets the 'time_range' query body parameter, determining a time window based on 'device_timestamp'.

Parameters

- **start** (*str in ISO 8601 timestamp*) – When to start the result search.
- **end** (*str in ISO 8601 timestamp*) – When to end the result search.
- **window** (*str*) – Time window to execute the result search, ending on the current time. Should be in the form "-2w", where y=year, w=week, d=day, h=hour, m=minute, s=second.

Note:

- *window* will take precendent over *start* and *end* if provided.

Examples

query = api.select(Event).set_time_range(start="2020-10-20T20:34:07Z") second_query = api.select(Event).set_time_range(start="2020-10-20T20:34:07Z", end="2020-10-30T20:34:07Z") third_query = api.select(Event).set_time_range(window='-3d')

timeout(*msecs*)
Sets the timeout on a process query.

Parameters **msecs** (*int*) – Timeout duration, in milliseconds.

Returns

The Query object with new milliseconds parameter.

Return type *Query* (*AsyncProcessQuery*)

Example:

```
>>> cb.select(Process).where(process_name="foo.exe").timeout(5000)
```

4.6.8 cbc_sdk.platform.reputation module

Model and Query Classes for Reputation

class ReputationOverride(*cb*, *model_unique_id*, *initial_data=None*)
Bases: *cbc_sdk.platform.base.PlatformModel*

Represents a ReputationOverride object in the Carbon Black server.

Variables

- ***id*** – An identifier for a reputation override
- ***created_by*** – Creator of the override
- ***create_time*** – Time the override was created
- ***description*** – Justification for override
- ***override_list*** – The override list to add a new reputation (BLACK_LIST only valid for SHA256)
- ***override_type*** – Process property match when applying override

- ***sha256_hash*** – A hexadecimal string of length 64 characters representing the SHA-256 hash of the application
- ***filename*** – An application name for the hash
- ***signed_by*** – Name of the signer for the application
- ***certificate_authority*** – Certificate authority that authorizes the validity of the certificate
- ***path*** – The absolute path to file or directory where tool exists on disk
- ***include_child_processes*** – Include tool's child processes on approved list

Initialize the ReputationOverride object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.
- **initial_data** (*dict*) – Initial data used to populate the alert.

classmethod bulk_delete(*cb*, *overrides*)

Deletes reputation overrides in bulk by id.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **overrides** (*List*) – List if reputation override ids

Example

["e9410b754ea011ebbfd0db2585a41b07"

]

certificate_authority = None

classmethod create(*cb*, *initial_data*)

Returns all vendors and products that have been seen for the organization.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **initial_data** (*Object*) – The initial data for a ReputationOverride

Example

{ "description": "Banned as known malware", "override_list": "BLACK_LIST", "override_type": "SHA256", "sha256_hash": "dd191a5b23df92e13a8852291f9fb5ed594b76a28a5a464418442584afd1e048", "filename": "foo.exe"

}

Returns The created ReputationOverride object based on the specified properties

Return type *ReputationOverride*

create_time = None

created_by = None

delete()
Delete this object.

description = None

filename = None

id = None

include_child_processes = None

override_list = None

override_type = None

path = None

primary_key = 'id'

sha256_hash = None

signed_by = None

urlobject = '/appservices/v6/orgs/{0}/reputations/overrides'

urlobject_single = '/appservices/v6/orgs/{0}/reputations/overrides/{1}'

class ReputationOverrideQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*

Represents a query that is used to locate ReputationOverride objects.

Initialize the ReputationOverrideQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

VALID_DIRECTIONS = ['ASC', 'DESC', 'asc', 'desc']

set_override_list(*override_list*)
Sets the override_list criteria filter.

Parameters **override_list** (*str*) – Override List to filter on.

Returns The ReputationOverrideQuery with specified override_list.

set_override_type(*override_type*)
Sets the override_type criteria filter.

Parameters **override_type** (*str*) – Override List to filter on.

Returns The ReputationOverrideQuery with specified override_type.

sort_by(*key*, *direction='ASC'*)
Sets the sorting behavior on a query's results.

Example

```
>>> cb.select(ReputationOverride).sort_by("create_time")
```

Parameters

- **key** (*str*) – The key in the schema to sort by.
- **direction** (*str*) – The sort order, either "ASC" or "DESC".

Returns This instance.

Return type *ReputationOverrideQuery*

Raises ApiError – If an invalid direction value is passed.

4.6.9 cbc_sdk.platform.users module

Model and Query Classes for Users

class User(*cb*, *model_unique_id*, *initial_data=None*)

Bases: *cbc_sdk.base.MutableBaseModel*

Represents a User object in the Carbon Black server.

Variables

- ***org_key*** – Organization key for this user
- ***auth_method*** – Method to be used for the user to authenticate
- ***admin_login_version*** – Version number of the user information
- ***email*** – User's E-mail address
- ***login_name*** – Login name for the user
- ***login_id*** – Login ID (user ID) for this user
- ***phone*** – User's phone number
- ***first_name*** – User's first name
- ***last_name*** – User's last name
- ***org_id*** – ID of the organization the user is in
- ***org_admin_version*** – TBD
- ***role*** – Not used, always "DEPRECATED"
- ***contact_id*** – ID of the user's contact information
- ***contact_version*** – Version of the user's contact information

Initialize the User object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*int*) – Login ID of this user.
- **initial_data** (*dict*) – Initial data used to populate the user.

class UserBuilder(*cb*)

Bases: object

Auxiliary object used to construct a new User.

Create the empty UserBuilder object.

Parameters **cb** (BaseAPI) – Reference to API object used to communicate with the server.

add_grant_profile(*orgs*, *roles*)
Adds a grant profile for the new user.

Parameters
- **orgs** (*list[str]*) – List of organizations to be allowed, specified as keys or URNs.
- **roles** (*list[str]*) – List of roles to be granted, specified as URNs.

Returns This object.
Return type *UserBuilder*

build()
Builds the new user.

Notes

The new user will not be "findable" by other API functions until it has been activated and its initial password has been set.

set_auth_method(*method*)
Sets the authentication method for the new user. The default is 'PASSWORD'.

Parameters **method** (*str*) – The authentication method for the new user.
Returns This object.
Return type *UserBuilder*

set_email(*email*)
Sets the E-mail address for the new user.

Parameters **email** (*str*) – The E-mail address for the new user.
Returns This object.
Return type *UserBuilder*

set_first_name(*first_name*)
Sets the first name for the new user.

Parameters **first_name** (*str*) – The first name for the new user.
Returns This object.
Return type *UserBuilder*

set_last_name(*last_name*)
Sets the last name for the new user.

Parameters **last_name** (*str*) – The last name for the new user.
Returns This object.
Return type *UserBuilder*

set_phone(*phone*)
Sets the phone number for the new user.

Parameters **phone** (*str*) – The phone number for the new user.
Returns This object.
Return type *UserBuilder*

set_role(*role*)
Sets the role URN for the new user.

Parameters **role** (*str*) – The URN of the role to set for the user.
Returns This object.
Return type *UserBuilder*

add_profiles(*profile_templates*)
Add the specified profiles to the user's grant.

Parameters **profile_templates** (*list[dict]*) – List of profile templates to be added to the user.

admin_login_version = None

auth_method = None

classmethod bulk_add_profiles(*users*, *profile_templates*)
Add the specified profiles to the specified users' grants.

Parameters

- **users** (*list[User]*) – List of User objects specifying users to be modified.
- **profile_templates** (*list[dict]*) – List of profile templates to be added to the users.

classmethod bulk_create(*cb*, *user_templates*, *profile_templates*)
Creates a series of new users.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **user_templates** (*list[dict]*) – List of templates for users to be created.
- **profile_templates** (*list[dict]*) – List of profile templates to be applied to each user.

classmethod bulk_delete(*users*)
Deletes all the listed users.

Parameters **users** (*list[User]*) – List of User objects specifying users to be deleted.

classmethod bulk_disable_all_access(*users*)
Disables all access profiles held by the listed users.

Parameters **users** (*list[User]*) – List of User objects specifying users to be disabled.

classmethod bulk_disable_profiles(*users*, *profile_templates*)
Disable the specified profiles in the specified users' grants.

Parameters

- **users** (*list[User]*) – List of User objects specifying users to be modified.
- **profile_templates** (*list[dict]*) – List of profile templates to be disabled.

change_role(*role_urn*, *org=None*)
Add the specified role to the user (either to the grant or the profiles).

Parameters

- **role_urn** (*str*) – URN of the role to be added.
- **org** (*str*) – If specified, only profiles that match this organization will have the role added. Organization may be specified as either an org key or a URN.

Raises ApiError – If the user is a "legacy" user that has no grant.

contact_id = None

contact_version = None

classmethod create(*cb*, *template=None*)
Creates a new user.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

- **template** (*dict*) – Optional template data for creating the new user.

Returns

If template is None, returns an instance of this object. Call methods on the object to set the values associated with the new user, and then call build() to create it.

Return type *UserBuilder*

disable_all_access()
Disables all access profiles held by ths user.

Raises ApiError – If the user is a "legacy" user that has no grant.

disable_profiles(*profile_templates*)
Disable the specified profiles in the user's grant.

Parameters **profile_templates** (*list[dict]*) – List of profile templates to be disabled.

Raises ApiError – If the user is a "legacy" user that has no grant.

email = None

first_name = None

grant()
Locates the access grant for this user.

Returns Access grant for this user, or None if the user has none.

Return type *Grant*

last_name = None

login_id = None

login_name = None

org_admin_version = None

org_id = None

org_key = None

org_urn
Returns the URN for this user's organization (used in accessing Grants).

Returns URN for this user's organization.

Return type str

phone = None

primary_key = 'login_id'

reset_google_authenticator_registration()
Forces Google Authenticator registration to be reset for this user.

role = None

set_profile_expiration(*profile_templates*, *expiration_date*)
Set the expiration time for the specified profiles in the user's grant.

Parameters

- **profile_templates** (*list[dict]*) – List of profile templates to be reset.
- **expiration_date** (*str*) – New expiration date, in ISO 8601 format.

Raises `ApiError` – If the user is a "legacy" user that has no grant.

urlobject = '/appservices/v6/orgs/{0}/users'

urlobject_single = '/appservices/v6/orgs/{0}/users/{1}'

urn
Returns the URN for this user (used in accessing Grants).

Returns URN for this user.

Return type str

class UserQuery(*doc_class*, *cb*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*

Query for retrieving users in bulk.

Initialize the Query object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (`CBCloudAPI`) – A reference to the CBCloudAPI object.

email_addresses(*addrs*)
Limit the query to users with the specified E-mail addresses. Call multiple times to add multiple addresses.

Parameters **addrs** (*list[str]*) – List of addresses to be added to the query.

Returns This object.

Return type *UserQuery*

user_ids(*userids*)
Limit the query to users with the specified user IDs. Call multiple times to add multiple user IDs.

Parameters **userids** (*list[str]*) – List of user IDs to be added to the query.

Returns This object.

Return type *UserQuery*

normalize_profile_list(*profile_templates*)
Internal function to normalize a list of profile templates.

4.6.10 Module contents

4.7 Workload

4.7.1 Submodules

4.7.2 cbc_sdk.workload.sensor_lifecycle module

Sensor Lifecycle Management for Workloads

class SensorKit(*cb*, *initial_data=None*)
Bases: *cbc_sdk.base.UnrefreshableModel*

Represents a SensorKit object in the Carbon Black server.

Variables

- ***sensor_type*** – The type of information this sensor is for.
- ***sensor_url*** – The URL for downloading the sensor installation package.
- ***sensor_config_url*** – The URL for downloading the sensor configuration information.
- ***error_code*** – Code for any error that occurred while getting the sensor information.
- ***message*** – Message for any error that occurred while getting the sensor information.

Initialize the SensorKit object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **initial_data** (*dict*) – Initial data used to populate the sensor kit data.

COMPUTE_RESOURCE_MAP = {'CENTOS': 'RHEL', 'ORACLE': 'RHEL', 'SLES': 'SUSE'}

VALID_ARCHITECTURES = ['32', '64', 'OTHER']

VALID_DEVICE_TYPES = ['WINDOWS', 'LINUX', 'MAC']

VALID_TYPES = ['WINDOWS', 'MAC', 'RHEL', 'UBUNTU', 'SUSE', 'AMAZON_LINUX']

error_code = None

classmethod from_type(*cb*, *device_type*, *architecture*, *sensor_type*, *version*)

Helper method used to create a temporary SensorKit object from its four components.

This method CANNOT be used to create an object that will be persisted to the server.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **device_type** (*str*) – Device type to be used. Valid values are "WINDOWS", "LINUX", and "MAC".
- **architecture** (*str*) – Architecture to be used. Valid values are "32", "64", and "OTHER".
- **sensor_type** (*str*) – Sensor type to be used. Valid values are "WINDOWS", "MAC", "RHEL", "UBUNTU", "SUSE", and "AMAZON_LINUX".
- **version** (*str*) – Sensor version number to be used.

Returns A SensorType object with those specified values.

Return type SensorType

Raises ApiError – If an invalid value was used for one of the three limited values.

classmethod get_config_template(*cb*)

Retrieve the sample config.ini file with the properties populated from the server.

Parameters **cb** (BaseAPI) – Reference to API object used to communicate with the server.

Returns Text of the sample configuration file.

Return type str

message = None

sensor_config_url = None

sensor_type = {}

sensor_url = None

class SensorKitQuery(*doc_class*, *cb*)

Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.CriteriaBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*

Query class used to read in SensorKit objects.

Initialize the SensorKitQuery.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

add_sensor_kit_type(*skit=None*, ***kwargs*)

Add a sensor kit type to the request.

Parameters

- **skit** (SensorKit) – The sensor kit type to be added to the request.
- ****kwargs** (*dict*) – If skit is None, the keyword arguments 'device_type', 'architecture', 'sensor_type', and 'version' are used to create the sensor kit type to be added.

Returns Reference to this object.

Return type *SensorKitQuery*

config_params(*params*)

Sets the configuration parameters for the sensor kit query request.

Parameters **params** (*str*) – The text of a config.ini file with a list of sensor properties to configure on installation.

Returns Reference to this object.

Return type *SensorKitQuery*

expires(*expiration_date_time*)

Sets the expiration date and time for the sensor kit query request.

Parameters **expiration_date_time** (*str*) – The time at which the sensor download link will expire, expressed as ISO 8601 UTC.

Returns Reference to this object.

Return type *SensorKitQuery*

4.7.3 cbc_sdk.workload.vm_workloads_search module

Model and Query Classes for VM Workloads Search API

class ComputeResource(*cb*, *model_unique_id*, *initial_data=None*)

Bases: *cbc_sdk.base.NewBaseModel*

Represents a ComputeResource object in the Carbon Black server.

Initialize the ComputeResource object.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **model_unique_id** (*str*) – ID of the alert represented.

- **initial_data** (*dict*) – Initial data used to populate the alert.

classmethod bulk_install(*cb*, *compute_resources*, *sensor_kit_types*, *config_file=None*)
Install a sensor on a list of compute resources.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **compute_resources** (*list*) – A list of ComputeResource objects used to specify compute resources to install sensors on.
- **sensor_kit_types** (*list*) – A list of SensorKit objects used to specify sensor types to choose from in installation.
- **config_file** (*str*) – The text of a config.ini file with a list of sensor properties to configure on installation.

Returns A dict with two members, 'type' and 'code', indicating the status of the installation.

Return type dict

classmethod bulk_install_by_id(*cb*, *compute_resources*, *sensor_kit_types*, *config_file=None*)
Install a sensor on a list of compute resources, specified by ID.

Parameters

- **cb** (BaseAPI) – Reference to API object used to communicate with the server.
- **compute_resources** (*list*) – A list of dicts, each of which contains the keys 'vcenter_uuid' and 'compute_resource_id', specifying the compute resources to install sensors on.
- **sensor_kit_types** (*list*) – A list of SensorKit objects used to specify sensor types to choose from in installation.
- **config_file** (*str*) – The text of a config.ini file with a list of sensor properties to configure on installation.

Returns A dict with two members, 'type' and 'code', indicating the status of the installation.

Return type dict

install_sensor(*sensor_version*, *config_file=None*)
Install a sensor on this compute resource.

Parameters

- **sensor_version** (*str*) – The version number of the sensor to be used.
- **config_file** (*str*) – The text of a config.ini file with a list of sensor properties to configure on installation.

Returns A dict with two members, 'type' and 'code', indicating the status of the installation.

Return type dict

Raises ApiError – If the compute node is not eligible or is of an invalid type.

primary_key = 'id'

urlobject = '/lcm/view/v1/orgs/{0}/compute_resources'

urlobject_single = '/lcm/view/v1/orgs/{0}/compute_resources/{1}'

class ComputeResourceQuery(*doc_class*, *cb*)

Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*

Represents a query that is used to locate ComputeResource objects.

Initialize the ComputeResource.

Parameters

- **doc_class** (*class*) – The model class that will be returned by this query.
- **cb** (BaseAPI) – Reference to API object used to communicate with the server.

VALID_DIRECTIONS = ('ASC', 'DESC')

VALID_ELIGIBILITY = ('ELIGIBLE', 'NOT_ELIGIBLE', 'UNSUPPORTED')

VALID_INSTALLATION_STATUS = ('SUCCESS', 'ERROR', 'PENDING', 'NOT_INSTALLED')

VALID_OS_ARCHITECTURE = ('32', '64')

VALID_OS_TYPE = ('WINDOWS', 'RHEL', 'UBUNTU', 'SUSE', 'SLES', 'CENTOS', 'OTHER', 'AMAZ

set_appliance_uuid(*appliance_uuid*)

Restricts the search that this query is performed on to the specified appliance uuid.

Parameters **appliance_uuid** (*list*) – List of string appliance uuids.

Returns This instance.

Return type *ComputeResourceQuery*

set_cluster_name(*cluster_name*)

Restricts the search that this query is performed on to the specified cluster name.

Parameters **cluster_name** (*list*) – List of string cluster names.

Returns This instance.

Return type *ComputeResourceQuery*

set_eligibility(*eligibility*)

Restricts the search that this query is performed on to the specified eligibility.

Parameters **eligibility** (*list*) – List of string eligibilities.

Returns This instance.

Return type *ComputeResourceQuery*

set_installation_status(*installation_status*)

Restricts the search that this query is performed on to the specified installation status.

Parameters **installation_status** (*list*) – List of string installation status.

Returns This instance.

Return type *ComputeResourceQuery*

set_ip_address(*ip_address*)

Restricts the search that this query is performed on to the specified ip address.

Parameters **ip_address** (*list*) – List of string ip addresses.

Returns This instance.

Return type *ComputeResourceQuery*

set_name(*name*)
Restricts the search that this query is performed on to the specified name.

Parameters **name** (*list*) – List of string names.

Returns This instance.

Return type *ComputeResourceQuery*

set_os_architecture(*os_architecture*)
Restricts the search that this query is performed on to the specified os architecture.

Parameters **os_architecture** (*list*) – List of string os architecture.

Returns This instance.

Return type *ComputeResourceQuery*

set_os_type(*os_type*)
Restricts the search that this query is performed on to the specified os type.

Parameters **os_type** (*list*) – List of string os type.

Returns This instance.

Return type *ComputeResourceQuery*

set_uuid(*uuid*)
Restricts the search that this query is performed on to the specified uuid.

Parameters **uuid** (*list*) – List of string uuid.

Returns This instance.

Return type *ComputeResourceQuery*

sort_by(*key*, *direction='ASC'*)
Sets the sorting behavior on a query's results.

Example

```
>>> cb.select(ComputeResource).sort_by("name")
```

Parameters

- **key** (*str*) – The key in the schema to sort by.
- **direction** (*str*) – The sort order.

Returns This instance.

Return type *ComputeResourceQuery*

log = <Logger cbc_sdk.workload.vm_workloads_search (WARNING)>
type: Workloads Search model

4.7.4 cbc_sdk.workload.vulnerability_assessment module

4.7.5 Module contents

4.8 CBC SDK

4.8.1 Subpackages

cbc_sdk.cache package

Submodules

cbc_sdk.cache.lru module

LRU cache based on stucchio's py-lru-cache module

original copy at https://github.com/stucchio/Python-LRU-cache licensed under MIT

class LRUCacheDict(*max_size=1024*, *expiration=900*, *thread_clear=False*, *concurrent=True*)

Bases: `object`

A dictionary-like object, supporting LRU caching semantics.

```
>>> d = LRUCacheDict(max_size=3, expiration=3)
>>> d['foo'] = 'bar'
>>> d['foo']
'bar'
>>> import time
>>> time.sleep(4) # 4 seconds > 3 second cache expiry of d
>>> d['foo']
Traceback (most recent call last):
    ...
KeyError: 'foo'
>>> d['a'] = 'A'
>>> d['b'] = 'B'
>>> d['c'] = 'C'
>>> d['d'] = 'D'
>>> d['a'] # Should return value error, since we exceeded the max cache size
Traceback (most recent call last):
    ...
KeyError: 'a'
```

By default, this cache will only expire items whenever you poke it - all methods on this class will result in a cleanup. If the thread_clear option is specified, a background thread will clean it up every thread_clear_min_check seconds.

If this class must be used in a multithreaded environment, the option concurrent should be set to true. Note that the cache will always be concurrent if a background cleanup thread is used.

Initialize the LRUCacheDict object.

Parameters

- **max_size** (*int*) – Maximum number of elements in the cache.
- **expiration** (*int*) – Number of seconds an item can be in the cache before it expires.

- **thread_clear** (*bool*) – True if we want to use a background thread to keep the cache clear.
- **concurrent** (*bool*) – True to make access to the cache thread-safe.

class EmptyCacheThread(*cache*, *peek_duration=60*)

Bases: threading.Thread

Background thread that expires elements out of the cache.

Initialize the EmptyCacheThread.

Parameters

- **cache** (LRUCacheDict) – The cache to be monitored.
- **peek_duration** (*int*) – The delay between "sweeps" of the cache.

daemon = True

run()

Execute the background cleanup.

cleanup(**args*, ***kwargs*)

clear(**args*, ***kwargs*)

has_key(**args*, ***kwargs*)

size(**args*, ***kwargs*)

class LRUCachedFunction(*function*, *cache=None*)

Bases: object

A memoized function, backed by an LRU cache.

```
>>> def f(x):
...     print "Calling f(" + str(x) + ")"
...     return x

(continues on next page)

(continued from previous page)

```
items in cache [3,4,5,6].
Calling f(4)
4
```

Initialize the LRUCachedFunction object.

Parameters

- **function** (*func*) – The function to be used to create new items in the cache.
- **cache** (LRUCacheDict) – The internal cache structure.

lru_cache_function(*max_size=1024*, *expiration=900*)

Least recently used cache function

```
>>> @lru_cache_function(3, 1)
... def f(x):
...     print "Calling f(" + str(x) + ")"
...     return x
>>> f(3)
Calling f(3)

```

Module contents

4.8.2 Submodules

4.8.3 cbc_sdk.base module

Models and Queries for the Base Carbon Black Cloud SDK

class ArrayFieldDescriptor(*field_name*, *coerce_to=None*, *default_value=None*)

Bases: *cbc_sdk.base.FieldDescriptor*

Field descriptor for fields of 'array' type.

Initialize the FieldDescriptor object.

Parameters

- **field_name** (*str*) – The name of the field.
- **coerce_to** (*class*) – The type to which the value should be coerced, or None.
- **default_value** (*Any*) – The default value of the field.

class AsyncQueryMixin

Bases: object

A mix-in which provides support for asynchronous queries.

execute_async()

Executes the current query in an asynchronous fashion.

Returns A future representing the query and its results.

Return type Future

class BaseQuery(*query=None*)
Bases: object

The base query for finding objects via the API.

Initializes the BaseQuery object.

Parameters **query** (*solrq.Q*) – The parent query of this one.

class BinaryFieldDescriptor(*field_name*, *coerce_to=None*, *default_value=None*)
Bases: *cbc_sdk.base.FieldDescriptor*

Field descriptor for fields of 'byte' type.

Initialize the FieldDescriptor object.

Parameters

- **field_name** (*str*) – The name of the field.
- **coerce_to** (*class*) – The type to which the value should be coerced, or None.
- **default_value** (*Any*) – The default value of the field.

class CbMetaModel
Bases: type

Meta-model for NewBaseModel and its subclasses.

Creates a new instance of a class, setting up the field descriptors based on the metafile.

Parameters

- **name** (*str*) – The name of the class.
- **bases** (*list*) – Base classes of the class to be created.
- **clsdict** (*dict*) – Elements defined in the new class.

model_base_directory = '/home/docs/checkouts/readthedocs.org/user_builds/carbon-black-

model_classes = [<class 'cbc_sdk.base.NewBaseModel'>, <class 'cbc_sdk.base.Unrefreshab

class CreatableModelMixin
Bases: object

Mixin for all objects which are creatable.

class CriteriaBuilderSupportMixin
Bases: object

A mixin that supplies wrapper methods to access the _crtieria.

add_criteria(*key*, *newlist*)
Add to the criteria on this query with a custom criteria key.

Will overwrite any existing criteria for the specified key.

Parameters

- **key** (*str*) – The key for the criteria item to be set.
- **newlist** (*str or list[str]*) – Value or list of values to be set for the criteria item.

Returns The query object with specified custom criteria.

Example

query = api.select(Event).add_criteria("event_type", ["filemod", "scriptload"]) query = api.select(Event).add_criteria("event_type", "filemod")

update_criteria(*key*, *newlist*)
Update the criteria on this query with a custom criteria key.

Parameters

- **key** (*str*) – The key for the criteria item to be set.
- **newlist** (*list*) – List of values to be set for the criteria item.

Returns The query object with specified custom criteria.

Example

query = api.select(Alert).update_criteria("my.criteria.key", ["criteria_value"])

Note: Use this method if there is no implemented method for your desired criteria.

class EpochDateTimeFieldDescriptor(*field_name*, *multiplier=1.0*)
Bases: *cbc_sdk.base.FieldDescriptor*

Field descriptor for fields of 'epoch-ms-date-time' type.

Initialize the EpochDateTimeFieldDescriptor object.

Parameters

- **field_name** (*str*) – The name of the field.
- **multiplier** (*float*) – Unused.

class FacetQuery(*cls*, *cb*, *query=None*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.AsyncQueryMixin*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*

Query class for asynchronous Facet API calls.

These API calls return one result, and are not paginated or iterable.

Initialize the FacetQuery object.

add_exclusions(*key*, *newlist*)
Add to the excluions on this query with a custom exclusion key.

Parameters

- **key** (*str*) – The key for the exclusion item to be set.
- **newlist** (*str or list[str]*) – Value or list of values to be set for the exclusion item.

Returns The ResultQuery with specified custom exclusion.

Example

query = api.select(Event).add_exclusions("netconn_domain", ["www.google.com"]) query = api.select(Event).add_exclusions("netconn_domain", "www.google.com")

add_facet_field(*field*)
Sets the facet fields to be received by this query.

Parameters **field** (*str or [str]*) – Field(s) to be received.

Returns The Query object that will receive the specified field(s).

Return type *Query* (AsyncQuery)

Example: >>> cb.select(ProcessFacet).add_facet_field([“process_name”, “process_username”])

add_range(*range*)
Sets the facet ranges to be received by this query.

Parameters **range** (*dict or [dict]*) – Range(s) to be received.

Returns The Query object that will receive the specified range(s).

Return type *Query* (AsyncQuery)

Note: The range parameter must be in this dictionary format:

{ “bucket_size”: “<object>”, “start”: “<object>”, “end”: “<object>”, “field”: “<string>”

}, where “bucket_size”, “start”, and “end” can be numbers or ISO 8601 timestamps.

Examples: >>> cb.select(ProcessFacet).add_range({“bucket_size”: 5, “start”: 0, “end”: 10, “field”: “netconn_count”}) >>> cb.select(ProcessFacet).add_range({“bucket_size”: “+1DAY”, “start”: “2020-11-01T00:00:00Z”,

“end”: “2020-11-12T00:00:00Z”, “field”: “backend_timestamp”})

limit(*limit*)
Sets the maximum number of facets per category (i.e. any Process Search Fields in self._fields).

The default limit for Process Facet searches in the Carbon Black Cloud backend is 100.

Parameters **limit** (*int*) – Maximum number of facets per category.

Returns The Query object with new limit parameter.

Return type *Query* (AsyncQuery)

Example: >>> cb.select(ProcessFacet).where(process_name=”foo.exe”).limit(50)

results
Save query results to self._results with self._search() method.

set_rows(*rows*)
Sets the number of facet results to return with the query.

Parameters **rows** (*int*) – Number of rows to return.

Returns The Query object with the new rows parameter.

Return type *Query* (AsyncQuery)

Example: >>> cb.select(ProcessFacet).set_rows(50)

set_time_range(*start=None*, *end=None*, *window=None*)
Sets the ‘time_range’ query body parameter, determining a time window based on ‘device_timestamp’.

Parameters

- **start** (*str in ISO 8601 timestamp*) – When to start the result search.
- **end** (*str in ISO 8601 timestamp*) – When to end the result search.

- **window** (*str*) – Time window to execute the result search, ending on the current time. Should be in the form "-2w", where y=year, w=week, d=day, h=hour, m=minute, s=second.

Note:

- *window* will take precendent over *start* and *end* if provided.

Examples

query = api.select(Event).set_time_range(start="2020-10-20T20:34:07Z") second_query = api.select(Event).set_time_range(start="2020-10-20T20:34:07Z", end="2020-10-30T20:34:07Z") third_query = api.select(Event).set_time_range(window='-3d')

timeout (*msecs*)

Sets the timeout on an AsyncQuery. By default, there is no timeout.

Parameters **msecs** (*int*) – Timeout duration, in milliseconds.

Returns

The Query object with new milliseconds parameter.

Return type *Query* (AsyncQuery)

Example:

```
>>> cb.select(ProcessFacet).where(process_name="foo.exe").timeout(5000)
```

class FieldDescriptor (*field_name*, *coerce_to=None*, *default_value=None*)

Bases: `object`

Object that describes a field within a model instance.

Initialize the FieldDescriptor object.

Parameters

- **field_name** (*str*) – The name of the field.
- **coerce_to** (*class*) – The type to which the value should be coerced, or None.
- **default_value** (*Any*) – The default value of the field.

class ForeignKeyFieldDescriptor (*field_name*, *join_model*, *join_field=None*)

Bases: *cbc_sdk.base.FieldDescriptor*

Field descriptor for fields that are foreign keys.

Initialize the ForeignKeyFieldDescriptor object.

Parameters

- **field_name** (*str*) – The name of the field.
- **join_model** (*class*) – The class for which this field value is a foreign key.
- **join_field** (*str*) – The name fo the field in the joined class for which this field value is a foreign key.

class IsoDateTimeFieldDescriptor(*field_name*)
Bases: *cbc_sdk.base.FieldDescriptor*

Field descriptor for fields of 'iso-date-time' type.

Initialize the IsoDateTimeFieldDescriptor object.

Parameters **field_name** (*str*) – The name of the field.

class IterableQueryMixin
Bases: object

A mix-in to provide iterability to a query.

all()
Returns all the items of a query as a list.

Returns List of query items

Return type list

first()
Returns the first item that would be returned as the result of a query.

Returns First query item

Return type obj

one()
Returns the only item that would be returned by a query.

Returns Sole query return item

Return type obj

Raises

- MoreThanOneResultError – If the query returns more than one item
- ObjectNotFoundError – If the query returns zero items

class MutableBaseModel(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=False*)
Bases: *cbc_sdk.base.NewBaseModel*

Represents a MutableBaseModel object in the Carbon Black server.

Initialize the NewBaseModel object.

Parameters

- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.
- **model_unique_id** (*Any*) – The unique ID for this particular instance of the model object.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

delete()
Delete this object.

is_dirty()
Returns whether or not any fields of this object have been changed.

Returns True if any fields of this object have been changed, False if not.

Return type bool

refresh()
Reload this object from the server.

reset()
Undo any changes made to this object's fields.

save()
Save any changes made to this object's fields.

Returns This object.

Return type *MutableBaseModel*

touch()
Force this object to be considered as changed.

validate()
Validates this object.

Returns True if the object is validated.

Return type bool

Raises `InvalidObjectError` – If the object has missing fields.

class NewBaseModel(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=False*)
Bases: `object`

Represents a NewBaseModel object in the Carbon Black server.

Initialize the NewBaseModel object.

Parameters

- **cb** (`CBCloudAPI`) – A reference to the CBCloudAPI object.
- **model_unique_id** (*Any*) – The unique ID for this particular instance of the model object.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

get(*attrname*, *default_val=None*)
Return an attribute of this object.

Parameters

- **attrname** (*str*) – Name of the attribute to be returned.
- **default_val** (*Any*) – Default value to be used if the attribute is not set.

Returns The returned attribute value, which may be defaulted.

Return type Any

classmethod new_object(*cb*, *item*, ***kwargs*)
Create a new object of a model class.

Parameters

- **cb** (`CBCloudAPI`) – Reference to the CBCloudAPI object.
- **item** (*dict*) – Item data to use to create the object.

- ****kwargs** (*dict*) – Additional keyword arguments.

Returns The new object instance.

Return type object

original_document
Returns the original meta-information about the object.

Returns The original meta-information about the object.

Return type object

primary_key = 'id'

refresh()
Reload this object from the server.

class ObjectFieldDescriptor(*field_name*, *coerce_to=None*, *default_value=None*)
Bases: *cbc_sdk.base.FieldDescriptor*

Field descriptor for fields of 'object' type.

Initialize the FieldDescriptor object.

Parameters

- **field_name** (*str*) – The name of the field.
- **coerce_to** (*class*) – The type to which the value should be coerced, or None.
- **default_value** (*Any*) – The default value of the field.

class PaginatedQuery(*cls*, *cb*, *query=None*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.IterableQueryMixin*

A query that returns objects in a paginated fashion.

Initialize the PaginatedQuery object.

Parameters

- **cls** (*class*) – The class of objects being returned by this query.
- **cb** (CBCloudAPI) – Reference to the CBCloudAPI object.
- **query** (BaseQuery) – The query that we are paginating.

batch_size(*new_batch_size*)
Set the batch size of the paginated query.

Parameters **new_batch_size** (*int*) – The new batch size.

Returns A new query with the updated batch size.

Return type *PaginatedQuery*

class Query(*doc_class*, *cb*)
Bases: *cbc_sdk.base.PaginatedQuery*, *cbc_sdk.base.QueryBuilderSupportMixin*, *cbc_sdk.base.IterableQueryMixin*, *cbc_sdk.base.AsyncQueryMixin*, *cbc_sdk.base.CriteriaBuilderSupportMixin*

Represents a prepared query to the Cb Enterprise EDR backend.

This object is returned as part of a *CbEnterpriseEDRAPI.select* operation on models requested from the Cb Enterprise EDR backend. You should not have to create this class yourself.

The query is not executed on the server until it's accessed, either as an iterator (where it will generate values on demand as they're requested) or as a list (where it will retrieve the entire result set and save to a list). You can also call the Python built-in `len()` on this object to retrieve the total number of items matching the query.

Examples:

```
>>> from cbc_sdk import CBCloudAPI
>>> from cbc_sdk.enterprise_edr import Report
>>> cb = CBCloudAPI()
>>> query = cb.select(Report)
>>> query = query.where(report_id="ABCDEFG1234")
>>> # alternatively:
>>> query = query.where("report_id:ABCDEFG1234")
```

Notes

- The slicing operator only supports start and end parameters, but not step. `[1:-1]` is legal, but `[1:2:-1]` is not.
- You can chain where clauses together to create AND queries; only objects that match all `where` clauses will be returned.

Initialize the Query object.

Parameters

- **doc_class** (*class*) – The class of the model this query returns.
- **cb** (CBCloudAPI) – A reference to the CBCloudAPI object.

add_exclusions(*key*, *newlist*)
Add to the excluions on this query with a custom exclusion key.

Parameters

- **key** (*str*) – The key for the exclusion item to be set.
- **newlist** (*str or list[str]*) – Value or list of values to be set for the exclusion item.

Returns The ResultQuery with specified custom exclusion.

Example

query = api.select(Event).add_exclusions("netconn_domain", ["www.google.com"]) query = api.select(Event).add_exclusions("netconn_domain", "www.google.com")

set_fields(*fields*)
Sets the fields to be returned with the response.

Parameters **fields** (*str or list[str]*) – Field or list of fields to be returned.

set_rows(*rows*)
Sets the 'rows' query body parameter, determining how many rows of results to request.

Parameters **rows** (*int*) – How many rows to request.

set_start(*start*)
Sets the 'start' query body parameter, determining where to begin retrieving results from.

Parameters **start** (*int*) – Where to start results from.

set_time_range(*start=None*, *end=None*, *window=None*)
Sets the 'time_range' query body parameter, determining a time window based on 'device_timestamp'.

Parameters

- **start** (*str in ISO 8601 timestamp*) – When to start the result search.
- **end** (*str in ISO 8601 timestamp*) – When to end the result search.
- **window** (*str*) – Time window to execute the result search, ending on the current time. Should be in the form "-2w", where y=year, w=week, d=day, h=hour, m=minute, s=second.

Note:

- *window* will take precendent over *start* and *end* if provided.

Examples

query = api.select(Event).set_time_range(start="2020-10-20T20:34:07Z") second_query = api.select(Event).set_time_range(start="2020-10-20T20:34:07Z", end="2020-10-30T20:34:07Z") third_query = api.select(Event).set_time_range(window='-3d')

sort_by(*key*, *direction='ASC'*)
Sets the sorting behavior on a query's results.

Parameters

- **key** (*str*) – The key in the schema to sort by.
- **direction** (*str*) – The sort order, either "ASC" or "DESC".

Returns The query with sorting parameters.

Return type *Query*

Example:

```
>>> cb.select(Process).where(process_name="cmd.exe").sort_by("device_timestamp
↪")
```

class QueryBuilder(***kwargs*)
Bases: object

Provides a flexible interface for building prepared queries for the CB Cloud backend.

This object can be instantiated directly, or can be managed implicitly through the CBCloudAPI.select API.

Examples: >>> from cbc_sdk.base import QueryBuilder >>> # build a query with chaining >>> query = QueryBuilder().where(process_name="malicious.exe").and_(device_name="suspect") >>> # start with an initial query, and chain another condition to it >>> query = QueryBuilder(device_os="WINDOWS").or_(process_username="root")

Initialize the QueryBuilder object.

Parameters ****kwargs** (*dict*) – If present, these are used to construct a Solrq Query.

and_(*q*, ***kwargs*)
Adds a conjunctive filter to a QueryBuilder.

Parameters

- **q** (*object*) – Either a string or solrq.Q object representing the query to be added.
- ****kwargs** (*dict*) – Arguments with which to construct a solrq.Q object.

Returns This object.

Return type *QueryBuilder*

Raises ApiError – If the q parameter is of an invalid type.

not_(*q*, ***kwargs*)
Adds a negative filter to a QueryBuilder.

Parameters

- **q** (*object*) – Either a string or solrq.Q object representing the query to be added.
- ****kwargs** (*dict*) – Arguments with which to construct a solrq.Q object.

Returns This object.

Return type *QueryBuilder*

Raises ApiError – If the q parameter is of an invalid type.

or_(*q*, ***kwargs*)
Adds a disjunctive filter to a QueryBuilder.

Parameters

- **q** (*object*) – Either a string or solrq.Q object representing the query to be added.
- ****kwargs** (*dict*) – Arguments with which to construct a solrq.Q object.

Returns This object.

Return type *QueryBuilder*

Raises ApiError – If the q parameter is of an invalid type.

where(*q*, ***kwargs*)
Adds a conjunctive filter to a QueryBuilder.

Parameters

- **q** (*object*) – Either a string or solrq.Q object representing the query to be added.
- ****kwargs** (*dict*) – Arguments with which to construct a solrq.Q object.

Returns This object.

Return type *QueryBuilder*

Raises ApiError – If the q parameter is of an invalid type.

class QueryBuilderSupportMixin
Bases: object

A mixin that supplies wrapper methods to access the _query_builder.

and_(*q=None*, ***kwargs*)
Add a conjunctive filter to this query.

Parameters

- **q** (*Any*) – Query string or *solrq.Q* object
- ****kwargs** (*dict*) – Arguments to construct a *solrq.Q* with

Returns This Query object.

Return type *Query*

not_(*q=None*, ***kwargs*)
Adds a negated filter to this query.

Parameters

- **q** (*solrq.Q*) – Query object.
- ****kwargs** (*dict*) – Arguments to construct a *solrq.Q* with.

Returns This Query object.

Return type *Query*

or_(*q=None*, ***kwargs*)
Add a disjunctive filter to this query.

Parameters

- **q** (*solrq.Q*) – Query object.
- ****kwargs** (*dict*) – Arguments to construct a *solrq.Q* with.

Returns This Query object.

Return type *Query*

where(*q=None*, ***kwargs*)
Add a filter to this query.

Parameters

- **q** (*Any*) – Query string, *QueryBuilder*, or *solrq.Q* object
- ****kwargs** (*dict*) – Arguments to construct a *solrq.Q* with

Returns This Query object.

Return type *Query*

class SimpleQuery(*cls*, *cb*, *urlobject=None*, *returns_fulldoc=True*)
Bases: *cbc_sdk.base.BaseQuery*, *cbc_sdk.base.IterableQueryMixin*

A simple query object.

Initialize the SimpleQuery object.

Parameters

- **cls** (*class*) – Class of the object to be returned by the query.
- **cb** (*CBCloudAPI*) – Reference to the CBCloudAPI object.
- **urlobject** (*str*) – URL to be used in making the query.
- **returns_fulldoc** (*bool*) – Whether the result of the Query yields objects that have been fully initialized.

and_(*new_query*)
Add an additional "where" clause to this query.

Parameters **new_query** (*object*) – The additional "where" clause, as a string or solrq.Q object.

Returns A new query with the extra "where" clause specified.

Return type *SimpleQuery*

results
Collect and return the results of this query.

Returns The results of this query.

Return type list

sort(*new_sort*)
Set the sorting for this query.

Parameters **new_sort** (*object*) – The new sort criteria for this query.

Returns A new query with the sort parameter specified.

Return type *SimpleQuery*

where(*new_query*)
Add a "where" clause to this query.

Parameters **new_query** (*object*) – The "where" clause, as a string or solrq.Q object.

Returns A new query with the "where" clause specified.

Return type *SimpleQuery*

class UnrefreshableModel(*cb*, *model_unique_id=None*, *initial_data=None*, *force_init=False*, *full_doc=False*)
Bases: *cbc_sdk.base.NewBaseModel*

Represents a UnrefreshableModel object in the Carbon Black server.

Initialize the NewBaseModel object.

Parameters

- **cb** (*CBCloudAPI*) – A reference to the CBCloudAPI object.
- **model_unique_id** (*Any*) – The unique ID for this particular instance of the model object.
- **initial_data** (*dict*) – The data to use when initializing the model object.
- **force_init** (*bool*) – True to force object initialization.
- **full_doc** (*bool*) – True to mark the object as fully initialized.

refresh()
Reload this object from the server.

log = <Logger cbc_sdk.base (WARNING)>
Base Models

4.8.4 cbc_sdk.connection module

Manages the CBC SDK connection to the server.

class BaseAPI(**args*, ***kwargs*)
Bases: object

The base API object used by all CBC SDK objects to communicate with the server.

Initialize the base API information.

Parameters

- ***args** – Unused.

- ****kwargs** – Additional arguments.

api_json_request(*method*, *uri*, ***kwargs*)
Submit a request to the server.

Parameters

- **method** (*str*) – HTTP method to use.
- **uri** (*str*) – URI to submit the request to.
- ****kwargs** (*dict*) – Additional arguments.

Returns Result of the operation.

Return type object

Raises ServerError – If there's an error output from the server.

create(*cls*, *data=None*)
Create a new object.

Parameters

- **cls** (*class*) – The Model class (only some models can be created, for example, Feed, Notification, ...)
- **data** (*object*) – The data used to initialize the new object

Returns An empty instance of the model class.

Return type Model

Raises ApiError – If the Model cannot be created.

delete_object(*uri*)
Send a DELETE request to the specified URI.

Parameters **uri** (*str*) – The URI to send the DELETE request to.

Returns The return data from the DELETE request.

Return type object

get_object(*uri*, *query_parameters=None*, *default=None*)
Submit a GET request to the server and parse the result as JSON before returning.

Parameters

- **uri** (*str*) – The URI to send the GET request to.
- **query_parameters** (*object*) – Parameters for the query.
- **default** (*object*) – What gets returned in the event of an empty response.

Returns Result of the GET request.

Return type object

get_raw_data(*uri*, *query_parameters=None*, *default=None*, ***kwargs*)
Submit a GET request to the server and return the result without parsing it.

Parameters

- **uri** (*str*) – The URI to send the GET request to.
- **query_parameters** (*object*) – Parameters for the query.
- **default** (*object*) – What gets returned in the event of an empty response.

- ****kwargs** –

Returns Result of the GET request.

Return type object

post_multipart(*uri*, *param_table*, ***kwargs*)
Send a POST request to the specified URI, with parameters sent as multipart form data.

Parameters

- **uri** (*str*) – The URI to send the POST request to.
- **param_table** (*dict*) – A dict of known parameters to the underlying method, each element of which is a parameter name mapped to a dict, which contains elements 'filename' and 'type' representing the pseudo-filename to be used for the data and the MIME type of the data.
- ****kwargs** (*dict*) – Arguments to pass to the API. Except for "headers," these will all be added as parameters to the form data sent.

Returns The return data from the POST request.

Return type object

post_object(*uri*, *body*, ***kwargs*)
Send a POST request to the specified URI.

Parameters

- **uri** (*str*) – The URI to send the POST request to.
- **body** (*object*) – The data to be sent in the body of the POST request.
- ****kwargs** –

Returns The return data from the POST request.

Return type object

put_object(*uri*, *body*, ***kwargs*)
Send a PUT request to the specified URI.

Parameters

- **uri** (*str*) – The URI to send the PUT request to.
- **body** (*object*) – The data to be sent in the body of the PUT request.
- ****kwargs** –

Returns The return data from the PUT request.

Return type object

raise_unless_json(*ret*, *expected*)
Raise a ServerError unless we got back an HTTP 200 response with JSON containing all the expected values.

Parameters

- **ret** (*object*) – Return value to be checked.
- **expected** (*dict*) – Expected keys and values that need to be found in the JSON response.

Raises ServerError – If the HTTP response is anything but 200, or if the expected values are not found.

select(*cls*, *unique_id=None*, **args*, ***kwargs*)
Prepare a query against the Carbon Black data store.

Parameters

- **cls** (*class*) – The Model class (for example, Computer, Process, Binary, FileInstance) to query
- **unique_id** (*optional*) – The unique id of the object to retrieve, to retrieve a single object by ID
- ***args** –
- ****kwargs** –

Returns An instance of the Model class if a unique_id is provided, otherwise a Query object

Return type object

url
Return the connection URL.

Returns The connection URL.

Return type str

class CBCSDKSessionAdapter(*verify_hostname=True*, *force_tls_1_2=False*, *max_retries=0*, ***pool_kwargs*)
Bases: `requests.adapters.HTTPAdapter`

Adapter object used to handle TLS connections to the CB server.

Initialize the CBCSDKSessionManager.

Parameters

- **verify_hostname** (*boolean*) – True if we want to verify the hostname.
- **force_tls_1_2** (*boolean*) – True to force the use of TLS 1.2.
- **max_retries** (*int*) – Maximum number of retries.
- ****pool_kwargs** – Additional arguments.

Raises `ApiError` – If the library versions are too old to force the use of TLS 1.2.

init_poolmanager(*connections*, *maxsize*, *block=False*, ***pool_kwargs*)
Initialize the connection pool manager.

Parameters

- **connections** (*int*) – Initial number of connections to be used.
- **maxsize** (*int*) – Maximum size of the connection pool.
- **block** (*object*) – Blocking policy.
- ****pool_kwargs** – Additional arguments for the connection pool.

Returns None

class Connection(*credentials*, *integration_name=None*, *timeout=None*, *max_retries=None*, *proxy_session=None*, ***pool_kwargs*)
Bases: `object`

Object that encapsulates the HTTP connection to the CB server.

Initialize the Connection object.

Parameters

- **credentials** (*object*) – The credentials to use for the connection.
- **integration_name** (*str*) – The integration name being used.
- **timeout** (*int*) – The timeout value to use for HTTP requests on this connection.
- **max_retries** (*int*) – The maximum number of times to retry a request.
- **proxy_session** (*requests.Session*) –
- ****pool_kwargs** – Additional arguments to be used to initialize connection pooling.

Raises

- ApiError – If there's an internal error initializing the connection.
- ConnectionError – If there's a problem with the credentials.

delete(*url*, ***kwargs*)
Submit a DELETE request on this connection.

Parameters

- **url** (*str*) – The URL to submit the request to.
- ****kwargs** – Additional arguments for the request.

Returns Result of the HTTP request.

Return type object

get(*url*, ***kwargs*)
Submit a GET request on this connection.

Parameters

- **url** (*str*) – The URL to submit the request to.
- ****kwargs** – Additional arguments for the request.

Returns Result of the HTTP request.

Return type object

http_request(*method*, *url*, ***kwargs*)
Submit a HTTP request to the server.

Parameters

- **method** (*str*) – The method name to use for the HTTP request.
- **url** (*str*) – The URL to submit the request to.
- ****kwargs** – Additional arguments for the request.

Returns Result of the HTTP request.

Return type object

Raises

- ApiError – An unknown problem was detected.
- ClientError – The server returned an error code in the 4xx range, indicating a problem with the request.
- ConnectionError – A problem was seen with the HTTP connection.

- `ObjectNotFoundError` – The specified object was not found on the server.
- `QuerySyntaxError` – The query passed in had invalid syntax.
- `ServerError` – The server returned an error code in the 5xx range, indicating a problem on the server side.
- `TimeoutError` – The HTTP request timed out.
- `UnauthorizedError` – The stored credentials do not permit access to the specified request.

post (*url*, ***kwargs*)
Submit a POST request on this connection.

Parameters

- **url** (*str*) – The URL to submit the request to.
- ****kwargs** – Additional arguments for the request.

Returns Result of the HTTP request.

Return type object

put (*url*, ***kwargs*)
Submit a PUT request on this connection.

Parameters

- **url** (*str*) – The URL to submit the request to.
- ****kwargs** – Additional arguments for the request.

Returns Result of the HTTP request.

Return type object

check_python_tls_compatibility ()
Verify which level of TLS/SSL that this version of the code is compatible with.

Returns The maximum level of TLS/SSL that this version is compatible with.

Return type str

try_json (*resp*)
Return a parsed JSON representation of the input.

Parameters **resp** (*Response*) – Input to be parsed.

Returns The parsed JSON result, or an empty dict if the value is not valid JSON.

Return type object

4.8.5 cbc_sdk.credentials module

Credentials management for the CBC SDK.

class CredentialProvider
Bases: `object`

The interface implemented by a credential provider.

get_credentials (*section=None*)
Return a Credentials object containing the configured credentials.

Parameters **section** (*str*) – The credential section to retrieve.

Returns The credentials retrieved from that source.

Return type *Credentials*

Raises `CredentialError` – If there is any error retrieving the credentials.

class CredentialValue

Bases: `enum.Enum`

All possible credential values.

IGNORE_SYSTEM_PROXY = 9

INTEGRATION = 10

ORG_KEY = 3

PROXY = 8

SSL_CERT_FILE = 6

SSL_FORCE_TLS_1_2 = 7

SSL_VERIFY = 4

SSL_VERIFY_HOSTNAME = 5

TOKEN = 2

URL = 1

requires_boolean_value()

Return whether or not this credential requires a boolean value.

Returns True if the credential requires a Boolean value, False if not.

Return type bool

class Credentials(*values=None*)

Bases: `object`

The object that contains credentials retrieved from the credential provider.

Initialize the Credentials object.

Parameters **values** (*dict*) – Dictionary containing values to be set in the credentials.

Raises `CredentialError` – If the value is not correct for any credential of boolean type.

get_value(*key*)

Get the value of a credential.

Parameters **key** (*CredentialValues*) – The credential to be retrieved.

Returns The credential's value, or a default value if the value was not explicitly set.

Return type object

4.8.6 cbc_sdk.errors module

Exceptions that are thrown by CBC SDK operations.

exception ApiError(*message=None*, *original_exception=None*)

Bases: `Exception`

Base class for all CBC SDK errors; also raised for generic internal errors.

Initialize the ApiError.

Parameters

- **message** (*str*) – The actual error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception ClientError(*error_code*, *message*, *result=None*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

A ClientError is raised when an HTTP 4xx error code is returned from the Carbon Black server.

Initialize the ClientError.

Parameters

- **error_code** (*int*) – The error code that was received from the server.
- **message** (*str*) – The actual error message.
- **result** (*object*) – The result of the operation from the server.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception ConnectionError(*message=None*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

There was an error in the connection to the server.

Initialize the ApiError.

Parameters

- **message** (*str*) – The actual error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception CredentialError(*message=None*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

The credentials had an unspecified error.

Initialize the ApiError.

Parameters

- **message** (*str*) – The actual error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception InvalidHashError
Bases: Exception

An invalid hash value was used.

exception InvalidObjectError(*message=None*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

An invalid object was received by the server.

Initialize the ApiError.

Parameters

- **message** (*str*) – The actual error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception MoreThanOneResultError(*message=None*, *original_exception=None*, *results=None*)
Bases: *cbc_sdk.errors.ApiError*

Only one object was requested, but multiple matches were found in the Carbon Black datastore.

Initialize the MoreThanOneResultError.

Parameters

- **message** (*str*) – The actual error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.
- **results** (*list*) – List of results returned

exception NonQueryableModel(*message=None*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

A model that attempted to be queried which is not queryable

Initialize the ApiError.

Parameters

- **message** (*str*) – The actual error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception ObjectNotFoundError(*uri*, *message=None*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

The requested object could not be found in the Carbon Black datastore.

Initialize the ObjectNotFoundError.

Parameters

- **uri** (*str*) – The URI of the action that failed.
- **message** (*str*) – The error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception QuerySyntaxError(*uri*, *message=None*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

The request contains a query with malformed syntax.

Initialize the QuerySyntaxError.

Parameters

- **uri** (*str*) – The URI of the action that failed.
- **message** (*str*) – The error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception ServerError(*error_code*, *message*, *result=None*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

A ServerError is raised when an HTTP 5xx error code is returned from the Carbon Black server.

Initialize the ServerError.

Parameters

- **error_code** (*int*) – The error code that was received from the server.
- **message** (*str*) – The actual error message.

- **result** (*object*) – The result of the operation from the server.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception TimeoutError(*uri=None*, *error_code=None*, *message=None*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

A requested operation timed out.

Initialize the TimeoutError.

Parameters

- **uri** (*str*) – The URI of the action that timed out.
- **error_code** (*int*) – The error code that was received from the server.
- **message** (*str*) – The error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception UnauthorizedError(*uri*, *message=None*, *action='read'*, *original_exception=None*)
Bases: *cbc_sdk.errors.ApiError*

The action that was attempted was not authorized.

Initialize the UnauthorizedError.

Parameters

- **uri** (*str*) – The URI of the action that was not authorized.
- **message** (*str*) – The error message.
- **action** (*str*) – The action that was being performed that was not authorized.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

4.8.7 cbc_sdk.helpers module

Helper functions which are not strictly part of the SDK API, but which are used by many of the examples.

build_cli_parser(*description='Cb Example Script'*)
Build a basic CLI parser containing the arguments needed to create a CBCloudAPI. Additional arguments may be added.

Parameters **description** (*str*) – Description of the script, for use in help messages.

Returns The new argument parser.

Return type ArgumentParser

disable_insecure_warnings()
Disable warnings about insecure URLs.

eprint(**args*, ***kwargs*)
Print to standard error output.

Parameters

- ***args** (*list*) – Arguments to the print function.
- ****kwargs** (*dict*) – Keyword arguments to the print function.

get_cb_cloud_object(*args*)
Based on parsed command line arguments, create and return a CBCloudAPI object.

Parameters **args** (*Namespace*) – Arguments parsed from the command line.

Returns The CBCloudAPI object.

Return type *CBCloudAPI*

get_object_by_name_or_id(*cb*, *cls*, *name_field='name'*, *id=None*, *name=None*)
Locate an object in the API by either ID or name.

Parameters

- **cb** (CBCloudAPI) – Reference to the CBCloudAPI.
- **cls** (*class*) – Class of object to be found.
- **name_field** (*str*) – Name field to search on.
- **id** (*int*) – ID of object to search for. May be None to do name searching.
- **name** (*str*) – Object name to search on.
- **force_init** (*bool*) – True to force a new object found by ID to be initialized.

Returns List of objects that match the search criteria.

Return type list

read_iocs(*cb*, *file=<_io.TextIOWrapper name='<stdin>' mode='r' encoding='UTF-8'>*)
Read indicators of compromise from standard input.

Parameters

- **cb** (CBCloudAPI) – Reference to the CBCloudAPI.
- **file** – Not used.

Returns New report ID to be used. dict: The indicators of compromise that were read in.

Return type str

4.8.8 cbc_sdk.live_response_api module

The Live Response API and associated objects.

class CbLRManagerBase(*cb*, *timeout=30*, *keepalive_sessions=False*, *thread_pool_count=5*)
Bases: object

Live Response manager object.

Initialize the CbLRManagerBase object.

Parameters

- **cb** (BaseAPI) – The CBC SDK object reference.
- **timeout** (*int*) – Timeout to use for requests, in seconds.
- **keepalive_sessions** (*bool*) – If True, "ping" sessions occasionally to ensure they stay alive.
- **thread_pool_count** (*int*) – number of workers for async commands (optional)

cblr_base = ''

cblr_session_cls = NotImplemented

close_session(*device_id*, *session_id*)
Close the specified Live Response session.

Parameters

- **device_id** (*int*) – ID of the device.
- **session_id** (*int*) – ID of the session.

request_session(*device_id*, *async_mode=False*)
Initiate a new Live Response session.

Parameters **device_id** (*int*) – The device ID to use.

Returns The new Live Response session.

Return type *CbLRSessionBase*

stop_keepalive_thread()
Stops the keepalive thread.

submit_job(*job*, *device*)
Submit a new job to be executed as a Live Response.

Parameters

- **job** (*object*) – The job to be scheduled.
- **device** (*int*) – ID of the device to use for job execution.

Returns A reference to the running job.

Return type Future

class CbLRSessionBase(*cblr_manager*, *session_id*, *device_id*, *session_data=None*, *thread_pool_count=5*)
Bases: object

A Live Response session that interacts with a remote machine.

Initialize the CbLRSessionBase.

Parameters

- **cblr_manager** (CbLRManagerBase) – The Live Response manager governing this session.
- **session_id** (*str*) – The ID of this session.
- **device_id** (*int*) – The ID of the device (remote machine) we're connected to.
- **session_data** (*dict*) – Additional session data.
- **thread_pool_count** (*int*) – number of workers for async commands (optional)

MAX_RETRY_COUNT = 5

cancel_command(*command_id*)
Cancel command if it is in status PENDING.

Parameters **command_id** (*int*) – command_id

close()
Close the Live Response session.

command_status(*command_id*)
Check the status of async command

Parameters **command_id** (*int*) – command_id

Returns status of the command

create_directory(*dir_name*, *async_mode=False*)
Create a directory on the remote machine.

Parameters

- **dir_name** (*str*) – The new directory name.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async

create_process(*command_string*, *wait_for_output=True*, *remote_output_file_name=None*, *working_directory=None*, *wait_timeout=30*, *wait_for_completion=True*, *async_mode=False*)
Create a new process on the remote machine with the specified command string.

Example: >>> with c.select(Device, 1).lr_session() as lr_session: ... print(lr_session.create_process(r'cmd.exe /c "ping.exe 192.168.1.1"')) Pinging 192.168.1.1 with 32 bytes of data: Reply from 192.168.1.1: bytes=32 time<1ms TTL=64

Parameters

- **command_string** (*str*) – Command string used for the create process operation.
- **wait_for_output** (*bool*) – True to block on output from the new process (execute in foreground). This will also set wait_for_completion (below).
- **remote_output_file_name** (*str*) – The remote output file name used for process output.
- **working_directory** (*str*) – The working directory of the create process operation.
- **wait_timeout** (*int*) – Timeout used for this command.
- **wait_for_completion** (*bool*) – True to wait until the process is completed before returning.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async str: The output of the process.

create_registry_key(*regkey*, *async_mode=False*)
Create a new registry key on the remote machine.

Parameters

- **regkey** (*str*) – The registry key to create.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async

delete_file(*filename*, *async_mode=False*)
Delete the specified file name on the remote machine.

Parameters

- **filename** (*str*) – Name of the file to be deleted.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async

delete_registry_key(*regkey*, *async_mode=False*)
Delete a registry key on the remote machine.

Parameters

- **regkey** (*str*) – The registry key to delete.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async

delete_registry_value(*regkey*, *async_mode=False*)
Delete a registry value on the remote machine.

Parameters

- **regkey** (*str*) – The registry value to delete.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async

get_file(*file_name*, *timeout=None*, *delay=None*, *async_mode=False*)
Retrieve contents of the specified file on the remote machine.

Parameters

- **file_name** (*str*) – Name of the file to be retrieved.
- **timeout** (*int*) – Timeout for the operation.
- **delay** (*float*) – Delay in seconds to wait before command complete.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async str: Contents of the specified file.

get_raw_file(*file_name*, *timeout=None*, *delay=None*, *async_mode=False*)
Retrieve contents of the specified file on the remote machine.

Parameters

- **file_name** (*str*) – Name of the file to be retrieved.
- **timeout** (*int*) – Timeout for the operation.
- **delay** (*float*) – Delay in seconds to wait before command complete.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async or object: Contains the data of the file.

get_registry_value(*regkey*, *async_mode=False*)
Return the associated value of the specified registry key on the remote machine.

Example: >>> with c.select(Device, 1).lr_session() as lr_session: >>> pprint.pprint(lr_session.get_registry_value('HKLM\SYSTEM\CurrentControlSet\services\ACPI\Start')) {u'value_data': 0, u'value_name': u'Start', u'value_type': u'REG_DWORD'}

Parameters

- **regkey** (*str*) – The registry key to retrieve.

- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async or dict: A dictionary with keys of: value_data, value_name, value_type.

kill_process(*pid*, *async_mode=False*)
Terminate a process on the remote machine.

Parameters

- **pid** (*int*) – Process ID to be terminated.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async bool: True if success, False if failure.

list_directory(*dir_name*, *async_mode=False*)
List the contents of a directory on the remote machine.

Example: >>> with c.select(Device, 1).lr_session() as lr_session: ... pprint.pprint(lr_session.list_directory('C:\temp\')) [{u'attributes': [u'DIRECTORY'],

u'create_time': 1471897244, u'filename': u'.', u'last_access_time': 1476390670, u'last_write_time': 1476390670, u'size': 0},

{u'attributes': [u'DIRECTORY'], u'create_time': 1471897244, u'filename': u'..', u'last_access_time': 1476390670, u'last_write_time': 1476390670, u'size': 0},

{u'attributes': [u'ARCHIVE'], u'create_time': 1476390668, u'filename': u'test.txt', u'last_access_time': 1476390668, u'last_write_time': 1476390668, u'size': 0}]

Parameters

- **dir_name** (*str*) – Directory to list. This parameter should end with the path separator.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async or list: A list of dicts, each one describing a directory entry.

list_processes(*async_mode=False*)
List currently running processes on the remote machine.

Example: >>> with c.select(Device, 1).lr_session() as lr_session: ... print(lr_session.list_processes()[0]) {u'command_line': u'',

u'create_time': 1476260500, u'parent': 0, u'parent_guid': u'00000001-0000-0000-0000-000000000000', u'path': u'', u'pid': 4, u'proc_guid': u'00000001-0000-0004-01d2-2461a85e4546', u'sid': u's-1-5-18', u'username': u'NT AUTHORITY\SYSTEM'}

Parameters **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async or list: A list of dicts describing the processes.

list_registry_keys_and_values(*regkey*, *async_mode=False*)
Enumerate subkeys and values of the specified registry key on the remote machine.

Example: >>> with c.select(Device, 1).lr_session() as lr_session: >>> pprint.pprint(lr_session.list_registry_keys_and_values('HKLM\SYSTEM\CurrentControlSet\services\ACPI')) {'sub_keys': [u'Parameters', u'Enum'],

'values': [{u'value_data': 0,

u'value_name': u'Start', u'value_type': u'REG_DWORD'},

{u'value_data': 1, u'value_name': u'Type', u'value_type': u'REG_DWORD'},

{u'value_data': 3, u'value_name': u'ErrorControl', u'value_type': u'REG_DWORD'},

{u'value_data': u'system32\drivers\ACPI.sys', u'value_name': u'ImagePath', u'value_type': u'REG_EXPAND_SZ'},

{u'value_data': u'Microsoft ACPI Driver', u'value_name': u'DisplayName', u'value_type': u'REG_SZ'},

{u'value_data': u'Boot Bus Extender', u'value_name': u'Group', u'value_type': u'REG_SZ'},

{u'value_data': u'acpi.inf_x86_neutral_ddd3c514822f1b21', u'value_name': u'DriverPackageId', u'value_type': u'REG_SZ'},

{u'value_data': 1, u'value_name': u'Tag', u'value_type': u'REG_DWORD'}]}

Parameters

- **regkey** (*str*) – The registry key to enumerate.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns

command_id, future if ran async or dict: A dictionary with two keys, 'sub_keys' (a list of subkey names) and 'values' (a list of dicts

containing value data, name, and type).

list_registry_values(*regkey*, *async_mode=False*)

Enumerate all registry values from the specified registry key on the remote machine.

Parameters

- **regkey** (*str*) – The registry key to enumerate.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async or list: List of values for the registry key.

memdump(*local_filename*, *remote_filename=None*, *compress=False*, *async_mode=False*)

Perform a memory dump operation on the remote machine.

Parameters

- **local_filename** (*str*) – Name of the file the memory dump will be transferred to on the local machine.
- **remote_filename** (*str*) – Name of the file the memory dump will be stored in on the remote machine.
- **compress** (*bool*) – True to compress the file on the remote system.

- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async

put_file(*infp*, *remote_filename*, *async_mode=False*)
Create a new file on the remote machine with the specified data.

Example: >>> with c.select(Device, 1).lr_session() as lr_session: ... lr_session.put_file(open("test.txt", "rb"), r"c:test.txt")

Parameters

- **infp** (*object*) – Python file-like containing data to upload to the remote endpoint.
- **remote_filename** (*str*) – File name to create on the remote endpoint.
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async

set_registry_value(*regkey*, *value*, *overwrite=True*, *value_type=None*, *async_mode=False*)
Set a registry value on the specified registry key on the remote machine.

Example: >>> with c.select(Device, 1).lr_session() as lr_session: ... lr_session.set_registry_value('HKLM\SYSTEM\CurrentControlSet\services\ACPI\testvalue', 1)

Parameters

- **regkey** (*str*) – The registry key to set.
- **value** (*object*) – The value data.
- **overwrite** (*bool*) – If True, any existing value will be overwritten.
- **value_type** (*str*) – The type of value. Examples: REG_DWORD, REG_MULTI_SZ, REG_SZ
- **async_mode** (*bool*) – Flag showing whether the command should be executed asynchronously

Returns command_id, future if ran async

start_memdump(*remote_filename=None*, *compress=True*)
Start a memory dump operation on the remote machine.

Parameters

- **remote_filename** (*str*) – Name of the file the memory dump will be stored in on the remote machine.
- **compress** (*bool*) – True to compress the file on the remote system.

Returns Controlling object for the memory dump operation.

Return type *LiveResponseMemdump*

walk(*top*, *topdown=True*, *onerror=None*, *followlinks=False*)
Perform a full directory walk with recursion into subdirectories on the remote machine.

Note: walk does not support async_mode due to its behaviour, it can only be invoked synchronously Example: >>> with c.select(Device, 1).lr_session() as lr_session: ... for entry in lr_session.walk(directory_name): ... print(entry) ('C:\temp', [u'dir1', u'dir2'], [u'file1.txt'])

Parameters

- **top** (*str*) – Directory to recurse on.
- **topdown** (*bool*) – If True, start output from top level directory.
- **onerror** (*func*) – Callback if an error occurs. This function is called with one argument (the exception that occurred).
- **followlinks** (*bool*) – True to follow symbolic links.

Returns List of tuples containing directory name, subdirectory names, file names.

Return type list

class CompletionNotification(*device_id*)
Bases: object

The notification that an operation is complete.

Initialize the CompletionNotification.

Parameters **device_id** (*int*) – The device ID this notification is for.

class GetFileJob(*file_name*)
Bases: object

Object that retrieves a file via Live Response.

Initialize the GetFileJob.

Parameters **file_name** (*str*) – The name of the file to be fetched.

run(*session*)
Execute the file transfer.

Parameters **session** (CbLRSessionBase) – The Live Response session being used.

Returns The contents of the file being retrieved.

Return type str

class JobWorker(*cb*, *device_id*, *result_queue*)
Bases: threading.Thread

Thread object that executes individual Live Response jobs.

Initialize the JobWorker.

Parameters

- **cb** (BaseAPI) – The CBC SDK object reference.
- **device_id** (*int*) – The ID of the device being used.
- **result_queue** (*Queue*) – The queue where results are placed.

run()
Execute the job worker.

run_job(*work_item*)
Execute an individual WorkItem.

Parameters **work_item** (WorkItem) – The work item to execute.

exception LiveResponseError(*details*)
Bases: Exception

Exception raised for errors with Live Response.

Initialize the LiveResponseError.

Parameters **details** (*object*) – Details of the specific error.

class LiveResponseJobScheduler(*cb*, *max_workers=10*)
Bases: threading.Thread

Thread that schedules Live Response jobs.

Initialize the LiveResponseJobScheduler.

Parameters

- **cb** (BaseAPI) – The CBC SDK object reference.
- **max_workers** (*int*) – Maximum number of JobWorker threads to use.

daemon = True

run()
Execute the job scheduler.

submit_job(*work_item*)
Submit a new job to be processed.

Parameters **work_item** (WorkItem) – New job to be processed.

class LiveResponseMemdump(*lr_session*, *memdump_id*, *remote_filename*)
Bases: object

Object managing a memory dump on a remote machine.

Initialize the LiveResponseMemdump.

Parameters

- **lr_session** (*Session*) – The Live Response session to the machine doing the memory dump.
- **memdump_id** (*str*) – The ID of the memory dump being performed.
- **remote_filename** (*str*) – The file name the memory dump will be stored in on the remote machine.

delete()
Delete the memory dump file.

get(*local_filename*)
Retrieve the remote memory dump to a local file.

Parameters **local_filename** (*str*) – Filename locally that will receive the memory dump.

wait()
Wait for the remote memory dump to complete.

class LiveResponseSession(*cblr_manager*, *session_id*, *device_id*, *session_data=None*)
Bases: *cbc_sdk.live_response_api.CbLRSessionBase*

Public face of the Live Response session object.

Initializes the LiveResponseSession.

Parameters

- **cblr_manager** (LiveResponseSessionManager) – Reference to the session manager.
- **session_id** (*str*) – The ID of this session.
- **device_id** (*int*) – The ID of the device (remote machine) we're connected to.

- **session_data** (*dict*) – Additional session data.

class LiveResponseSessionManager(*cb*, *timeout=30*, *keepalive_sessions=False*)
Bases: *cbc_sdk.live_response_api.CbLRManagerBase*

Session manager for Live Response sessions.

Initialize the LiveResponseSessionManager - only needed to format cblr_base

cblr_base = '/appservices/v6/orgs/{}/liveresponse'

cblr_session_cls
alias of *LiveResponseSession*

session_status(*session_id*)
Check the status of a lr session

Parameters **session_id** (*str*) – The id of the session.

Returns Status of the session

Return type str

submit_job(*job*, *device*)
Submit a job for execution by the job scheduler.

Parameters

- **job** (*func*) – The job function to be executed.
- **device** (*object*) – The device ID or Device object the job will be executed on.

Returns A Future that will allow waiting until the job is complete.

Return type Future

class WorkItem(*fn*, *device_id*)
Bases: object

Work item for scheduling.

Initialize the WorkItem.

Parameters

- **fn** (*func*) – The function to be called to do the actual work.
- **device_id** (*object*) – The device ID or Device object the work item is directed for.

class WorkerStatus(*device_id*, *status='READY'*, *exception=None*)
Bases: object

Holds the status of an individual worker.

Initialize the WorkerStatus.

Parameters

- **device_id** (*int*) – The device ID this status is for.
- **status** (*str*) – The current status value.
- **exception** (*Exception*) – Any exception that happened.

jobrunner(*callable*, *cb*, *device_id*)
Wrap a callable object with a live response session.

Parameters

- **callable** (*object*) – The object to be wrapped.
- **cb** (BaseAPI) – The CBC SDK object reference.
- **device_id** (*int*) – The device ID to use to get the session.

Returns The wrapped object.

Return type object

poll_status(*cb*, *url*, *desired_status='COMPLETE'*, *timeout=None*, *delay=None*)
Poll the status of a Live Response query.

Parameters

- **cb** (BaseAPI) – The CBC SDK object reference.
- **url** (*str*) – The URL to poll.
- **desired_status** (*str*) – The status we're looking for.
- **timeout** (*int*) – The timeout value in seconds.
- **delay** (*float*) – The delay between attempts in seconds.

Returns The result of the Live Response query that has the desired status.

Return type object

Raises *LiveResponseError* – If an error response was encountered.

4.8.9 cbc_sdk.rest_api module

Definition of the CBCloudAPI object, the core object for interacting with the Carbon Black Cloud SDK.

class CBCloudAPI(**args*, ***kwargs*)
Bases: *cbc_sdk.connection.BaseAPI*

The main entry point into the CBCloudAPI.

Usage:

```
>>> from cbc_sdk import CBCloudAPI
>>> cb = CBCloudAPI(profile="production")
```

Initialize the CBCloudAPI object.

Parameters

- ***args** (*list*) – List of arguments to pass to the API object.
- ****kwargs** (*dict*) – Keyword arguments to pass to the API object.

Keyword Arguments **profile** (*str*) – Use the credentials in the named profile when connecting to the Carbon Black server. Uses the profile named 'default' when not specified.

alert_search_suggestions(*query*)
Returns suggestions for keys and field values that can be used in a search.

Parameters **query** (*str*) – A search query to use.

Returns A list of search suggestions expressed as dict objects.

Return type list

audit_remediation(*sql*)
Run an audit-remediation query.

Parameters **sql** (*str*) – The SQL for the query.

Returns The query object.

Return type *Query*

audit_remediation_history(*query=None*)
Run an audit-remediation history query.

Parameters **query** (*str*) – The SQL for the query.

Returns The query object.

Return type *Query*

bulk_threat_dismiss(*threat_ids*, *remediation=None*, *comment=None*)
Dismiss the alerts associated with multiple threat IDs. The alerts will be left in a DISMISSED state.

Parameters

- **threat_ids** (*list*) – List of string threat IDs.
- **remediation** (*str*) – The remediation state to set for all alerts.
- **comment** (*str*) – The comment to set for all alerts.

Returns The request ID of the pending request, which may be used to select a WorkflowStatus object.

Return type str

bulk_threat_update(*threat_ids*, *remediation=None*, *comment=None*)
Update the alert status of alerts associated with multiple threat IDs. The alerts will be left in an OPEN state

Parameters

- **threat_ids** (*list*) – List of string threat IDs.
- **remediation** (*str*) – The remediation state to set for all alerts.
- **comment** (*str*) – The comment to set for all alerts.

Returns The request ID of the pending request, which may be used to select a WorkflowStatus object.

Return type str

convert_feed_query(*query*)
Converts a legacy CB Response query to a ThreatHunter query.

Parameters **query** (*str*) – The query to convert.

Returns The converted query.

Return type str

create(*cls*, *data=None*)
Creates a new model.

Parameters

- **cls** (*class*) – The model being created.
- **data** (*dict*) – The data to pre-populate the model with.

Returns An instance of *cls*.

Return type object

Examples: >>> feed = cb.create(Feed, feed_data)

custom_severities
Returns a list of active ReportSeverity instances.

device_background_scan(*device_ids*, *scan*)
Set the background scan option for the specified devices.

Parameters

- **device_ids** (*list*) – List of IDs of devices to be set.
- **scan** (*bool*) – True to turn background scan on, False to turn it off.

Returns The parsed JSON output from the request.

Return type dict

Raises ServerError – If the API method returns an HTTP error code.

device_bypass(*device_ids*, *enable*)
Set the bypass option for the specified devices.

Parameters

- **device_ids** (*list*) – List of IDs of devices to be set.
- **enable** (*bool*) – True to enable bypass, False to disable it.

Returns The parsed JSON output from the request.

Return type dict

Raises ServerError – If the API method returns an HTTP error code.

device_delete_sensor(*device_ids*)
Delete the specified sensor devices.

Parameters **device_ids** (*list*) – List of IDs of devices to be deleted.

Returns The parsed JSON output from the request.

Return type dict

Raises ServerError – If the API method returns an HTTP error code.

device_quarantine(*device_ids*, *enable*)
Set the quarantine option for the specified devices.

Parameters

- **device_ids** (*list*) – List of IDs of devices to be set.
- **enable** (*bool*) – True to enable quarantine, False to disable it.

Returns The parsed JSON output from the request.

Return type dict

Raises ServerError – If the API method returns an HTTP error code.

device_uninstall_sensor(*device_ids*)
Uninstall the specified sensor devices.

Parameters **device_ids** (*list*) – List of IDs of devices to be uninstalled.

Returns The parsed JSON output from the request.

Return type dict

Raises `ServerError` – If the API method returns an HTTP error code.

device_update_policy(*device_ids*, *policy_id*)
Set the current policy for the specified devices.

Parameters

- **device_ids** (*list*) – List of IDs of devices to be changed.
- **policy_id** (*int*) – ID of the policy to set for the devices.

Returns The parsed JSON output from the request.

Return type dict

Raises `ServerError` – If the API method returns an HTTP error code.

device_update_sensor_version(*device_ids*, *sensor_version*)
Update the sensor version for the specified devices.

Parameters

- **device_ids** (*list*) – List of IDs of devices to be changed.
- **sensor_version** (*dict*) – New version properties for the sensor.

Returns The parsed JSON output from the request.

Return type dict

Raises `ServerError` – If the API method returns an HTTP error code.

fetch_process_queries()
Retrieves a list of query IDs, active or complete, known by the ThreatHunter server.

get_auditlogs()
Retrieve queued audit logs from the Carbon Black Cloud Endpoint Standard server.

Note that this can only be used with a 'API' key generated in the CBC console.

Returns list of dictionary objects representing the audit logs, or an empty list if none available.

get_notifications()
Retrieve queued notifications (alerts) from the Cb Endpoint Standard server.

Note that this can only be used with a 'SIEM' key generated in the Cb Endpoint Standard console.

Returns List of dictionary objects representing the notifications, or an empty list if none available.

Return type list

live_response
Create and return the Live Response session manager.

Returns The session manager object.

Return type *LiveResponseSessionManager*

notification_listener(*interval=60*)
Generator to continually poll the Cb Endpoint Standard server for notifications (alerts).

Note that this can only be used with a 'SIEM' key generated in the Cb Endpoint Standard console.

org_urn
Returns the URN based on the configured org_key.

Returns The URN based on the configured org_key.

Return type str

process_limits()
Returns a dictionary containing API limiting information.

Examples: >>> cb.process_limits() {u'status_code': 200, u'time_bounds': {u'upper': 1545335070095, u'lower': 1542779216139}}

validate_process_query(*query*)
Validates the given IOC query.

Parameters **query** (*str*) – The query to validate.

Returns True if the query is valid, False if not.

Return type bool

Examples: >>> cb.validate_process_query("process_name:chrome.exe") # True

4.8.10 cbc_sdk.utils module

Utility functions for use within the CBC SDK.

convert_from_cb(*s*)
Parse a date and time value into a datetime object.

Parameters **s** (*str*) – The date and time string to parse. If this is None, we use the UNIX epoch timestamp.

Returns The parsed date and time.

Return type datetime

convert_query_params(*qd*)
Expand a dictionary of query parameters by turning "list" values into multiple pairings of key with value.

Parameters **qd** (*dict*) – A mapping of parameter names to values.

Returns A list of query parameters, each one a tuple containing name and value, after the expansion is applied.

Return type list

convert_to_cb(*dt*)
Convert a date and time to a string in the Carbon Black format.

Parameters **dt** (*datetime*) – The date and time to be converted.

Returns The date and time as a string.

Return type str

4.8.11 cbc_sdk.winerror module

Error related constants for win32

Generated by h2py from winerror.h

class CommDlgError

Bases: *cbc_sdk.winerror.ErrorBaseClass*

Collects all the common dialog error codes.

CCERR_CHOOSECOLORCODES = 20480

class ErrorBaseClass

Bases: `object`

Base class for repositories of error codes.

classmethod lookup_error(*error_code*)

Look up an error code by value.

Parameters **error_code** (*int*) – The error code to be looked up.

Returns The error code name.

Return type str

class ErrorMetaClass

Bases: `type`

Metaclass which establishes an easy means of looking up error codes in a collection.

Creates a new instance of a class, setting up the dict to make it easy to look up error codes.

Parameters

- **name** (*str*) – The name of the class.
- **bases** (*list*) – Base classes of the class to be created.
- **clsdict** (*dict*) – Elements defined in the new class.

FAILED(*Status*)

Return True iff a HRESULT/SCODE status represents failure.

class Facility

Bases: *cbc_sdk.winerror.ErrorBaseClass*

Collects all known facility codes.

FACILITY_AAF = 18

FACILITY_ACS = 20

FACILITY_BACKGROUNDCOPY = 32

FACILITY_WINRM = 51

GetScode(*hr*)
Turn a HRESULT into a SCODE.

HRESULT_CODE(*hr*)
Return the error code field of a HRESULT.

HRESULT_FACILITY(*hr*)
Return the facility field of a HRESULT.

HRESULT_FROM_NT(*x*)
Turn an NT error code into a HRESULT.

HRESULT_FROM_WIN32(*scode*)
Return the HRESULT corresponding to a Win32 error code.

HRESULT_SEVERITY(*hr*)
Return the severity field of a HRESULT.

class RawErrorCode
Bases: *cbc_sdk.winerror.ErrorBaseClass*

Collects all known error codes defined as raw SCODEs (from COM, OLE, etc.)

ResultFromScode(*sc*)
Turn a SCODE into a HRESULT.

SCODE_CODE(*sc*)
Return the error code field of a SCODE.

SCODE_FACILITY(*sc*)
Return the facility field of a SCODE.

SCODE_SEVERITY(*sc*)
Return the severity field of a SCODE.

SUCCEEDED(*Status*)
Return True iff a HRESULT/SCODE status represents success.

class Win32Error

Bases: *cbc_sdk.winerror.ErrorBaseClass*

Collects all the Win32 error codes.

decode_hresult(*hresult*)
Look up a Win32 error code based on the error code in a HRESULT.

4.8.12 Module contents

4.9 Exceptions

If an error occurs, the API attempts to roll the error into an appropriate Exception class.

4.9.1 Exception Classes

exception ApiError(*message=None*, *original_exception=None*)
Base class for all CBC SDK errors; also raised for generic internal errors.

Initialize the ApiError.

Parameters

- **message** (*str*) – The actual error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception CredentialError(*message=None*, *original_exception=None*)
The credentials had an unspecified error.

Initialize the ApiError.

Parameters

- **message** (*str*) – The actual error message.

- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception ServerError(*error_code*, *message*, *result=None*, *original_exception=None*)
A ServerError is raised when an HTTP 5xx error code is returned from the Carbon Black server.

Initialize the ServerError.

Parameters

- **error_code** (*int*) – The error code that was received from the server.
- **message** (*str*) – The actual error message.
- **result** (*object*) – The result of the operation from the server.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception ObjectNotFoundError(*uri*, *message=None*, *original_exception=None*)
The requested object could not be found in the Carbon Black datastore.

Initialize the ObjectNotFoundError.

Parameters

- **uri** (*str*) – The URI of the action that failed.
- **message** (*str*) – The error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception MoreThanOneResultError(*message=None*, *original_exception=None*, *results=None*)
Only one object was requested, but multiple matches were found in the Carbon Black datastore.

Initialize the MoreThanOneResultError.

Parameters

- **message** (*str*) – The actual error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.
- **results** (*list*) – List of results returned

exception InvalidObjectError(*message=None*, *original_exception=None*)
An invalid object was received by the server.

Initialize the ApiError.

Parameters

- **message** (*str*) – The actual error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.

exception TimeoutError(*uri=None*, *error_code=None*, *message=None*, *original_exception=None*)
A requested operation timed out.

Initialize the TimeoutError.

Parameters

- **uri** (*str*) – The URI of the action that timed out.
- **error_code** (*int*) – The error code that was received from the server.
- **message** (*str*) – The error message.
- **original_exception** (*Exception*) – The exception that caused this one to be raised.
